Groeneveld,2012-12-06 The present volume contains contributions presented at the NATO Advanced Study Institute on Molecular Ions held on the island of Kos Greece from September 30 to October 10 1980 The meeting was attended by some 60 participants from 15 different countries It was the first meeting devoted exclusively to the topic of molecular ions Its vitality derived from bringing together experts and students from a wide variety of disciplines whose studies bear upon the structure of molecular ions The aim of the meeting was to assemble these scientists representing many countries in Europe and North America to discuss the advances and capabilities of the various experimental and theoretical approaches and to point out unsolved problems and directions for future research The format involving lecturers and students served as a tutorial Molecular ions play an important role in very diverse fields of nature such as reactions in the ionosphere the processes of formation of molecules in dense interstellar clouds and the magnetohydrodynamics of plasmas used for energy generation Our understanding of the properties of molecular ions their electronic and geometric structures has been developing from a variety of sources as far removed as tickling ions with radiofrequency radiation and smashing them apart at relativistic energies Various laser techniques are described and the queen of structural determination spectroscopy is well represented On the instrumental side older techniques have been perfected and new methods have evolved

**Surface Mobilities on Solid Materials** Vu Thien Binh,2013-03-08 The surface of solids had long been considered simply the external boundary which determined the outside appearance of the solids but had no intrinsic character of its own The concept that surfaces have specific properties and are the first and foremost means of communication between individual things and the rest of the universe is fairly new coming into prominence only in the early sixties This new concept of surface properties was the result of a vast accumulation of knowledge due to recent development of research in this area This breakthrough of surface science resulted from the combined action of four factors i control of surface sample preparation ii control of the surface environment iii improvement of measurement tools and techniques and iv the importance of surface properties in many new industrial areas Nearly eighty techniques are now available to help us answer to the following questions what is the surface structure or arrangement of surface atoms what are the atomic species present what is the spatial distribution of foreign atoms what are the nature and distribution of possible defects on the surface what is the electronic structure of the surface atoms what is the motion of atoms on the surface In general two or more analytical techniques are used concurrently to assure unequivocal answers to problems Different techniques employ different combinations of incident probes and the scattered or secondary particles that convey information regarding the surfaces

**Atomic Physics of Highly Ionized Atoms** Richard Marrus,2012-12-06 The last decade has seen dramatic progress in the development of devices for producing multicharged ions Indeed it is now possible to produce any charge state of any ion right up through 92 fully stripped uranium U Equally dramatic progress has been achieved in the energy range of the available ions As an example fully stripped neon ions have been produced in useable quantities with kinetic energies ranging

from a few eV to more than 20 GeV. Interest in the atomic physics of multicharged ions has grown apace. In the fusion program the spectra of these ions is an important diagnostic tool. Moreover the presence of multicharged ions presents a serious energy loss mechanism in fusion devices. This fact has motivated a program to study the collision mechanisms involved. In another area multicharged ions are present in the solar corona and the interstellar medium and knowledge of their collision properties and spectra is essential to understanding the astrophysics. Other possible applications are to x-ray lasers and heavy ion inertial fusion. On a more fundamental level new possibilities for testing quantum electrodynamics with multicharged ions have emerged.

**Quantum Optics, Experimental Gravity, and Measurement Theory** Pierre Meystre, Marian O. Scully, 2012-12-06. This volume contains the Proceedings of the NATO Advanced Study Institute Quantum Optics and Experimental General Relativity which was held in Bad Windsheim Federal Republic of Germany from August 16 to 29 1981. At first glance one might wonder why a meeting should cover these two topics and a good bit of quantum measurement theory as well, all of which seem to be completely unrelated. The key to what one may call this grand unification lies in the effort underway in a number of laboratories around the world to detect gravitational radiation. Present research is pursuing the development of two types of detectors: laser interferometers and resonant bar detectors. Because the signals that one is trying to measure are so weak the quantum mechanical nature of the detectors comes into play. The analysis of the effects which result from this is facilitated by the use of techniques which have been developed in quantum optics over the years. This analysis also forces one to confront certain issues in the quantum theory of measurement. The laser interferometer detectors using as they do light are clearly within the realm of subjects usually considered by quantum optics. For example the analysis of the noise present in such a detector can make use of the many techniques which have been developed in quantum optics.

*Integrated Optics* S. Martellucci, A.N. Chester, 2013-06-29. This volume contains the proceedings of a two week NATO ASI on Integrated Optics Physics and Applications held from August 17 to August 30 1981 in Erice Italy. This is the 8th annual Course of the International School of Quantum Electronics presented under the auspices of the E. Majorana Centre for Scientific Culture. The subject was chosen in order to satisfy the demand for a course on integrated optics which is relevant to the expanding use of fiber optics for communication and signal processing. Integrated Optics encompassing all of the optical waveguide circuits which are the optical analog of integrated circuits is finding its way into a variety of applications involving communications, high speed signal processing and sensors of many kinds. However because the technology is still changing very rapidly the development of these exciting applications relies heavily upon the physics of the integrated optical circuits themselves and the processing techniques used to fabricate them. This NATO ASI provided not only a thorough tutorial treatment of the field but also through panel discussions and additional lectures treated topics at the forefront of present work. Therefore the character of the Course was a blend of current research and tutorial reviews. The Physics and Applications of Integrated Optics could hardly be a more appropriate title to be chosen for this.

volume Many of the worlds acknowledged leaders in the field have been brought together to review and speculate on the accomplishments of integrated optics Film Deposition by Plasma Techniques Mitsuharu Konuma,2012-12-06 Properties of thin films depend strongly upon the deposition technique and conditions chosen In order to achieve the desired film optimum deposition conditions have to be found by carrying out experiments in a trial and error fashion with varying parameters The data obtained on one growth apparatus are often not transferable to another This is especially true for film deposition processes using a cold plasma because of our poor under standing of the mechanisms Relatively precise studies have been carried out on the role that physical effects play in film formation such as sputter deposition However there are many open questions regarding processes that involve chemical reactions for example reactive sputter deposition or plasma enhanced chemical vapor deposition Much further research is re quired in order to understand the fundamental deposition processes A sys tematic collection of basic data some of which may be readily available in other branches of science for example reaction cross sections for gases with energetic electrons is also required The need for pfasma deposition techniques is felt strongly in industrial applications because these techniques are superior to traditional thin film deposition techniques in many ways In fact plasma deposition techniques have developed rapidly in the semiconductor and electronics industries Fields of possible application are still expanding A reliable plasma reactor with an adequate in situ system for monitoring the deposition conditions and film properties must be developed to improve reproducibility and pro ductivity at the industrial level

**Radiative Processes in Discharge Plasmas** Joseph M. Proud, Lawrence H. Luessen,2013-06-29 An Advanced Study Institute on Radiative Processes in Discharge Plasmas was held at the Atholl Palace Hotel Pitlochry Perthshire Scotland June 23 through July 5 1985 This publication is the Pro ceedings from that Institute The Institute was attended by eighty five Participants and Lecturers representing the United States Canada France West Germany Greece The Netherlands Portugal Turkey the United Kingdom and Switzerland A distinguished faculty of eighteen Lecturers was assembled and the topical program organized with the assistance of an Advisory Committee composed of Dr John Waymouth USA Dr Timm Teich Switzerland Dr Arthur Phelps USA Dr Nicol Peacock England Professor Erich Kunhardt USA Dr Anthony Hyder USA and Dr Arthur Guenther USA The underlying theme and objective of the Institute was the enhance ment of scientific communication and exchange among academic industrial and national laboratory groups having a common concern for radiative processes in discharge plasmas The program was organized into four major sessions sequentially treating the fundamental science of visible and near visible radiation in plasmas the technology of discharge light sources recent and novel methods for the generation of plasmas and an update on advances in laser based diagnostics Each major session culmi nated in a panel discussion comprised of the Lecturers for that session Advances in Laser Spectroscopy F. *The Glow Discharge* Frank Llewellyn-Jones, 1966 *Process Technologies for Water Treatment* S. Stucki, 2013-03-09 The Brown Boveri Scientific Symposia by now are part of a firmly established tradition This is the tenth event in a series which was initiated shortly after Corporate Research was created as a separate entity in our company the symposia are held every other year The themes have been 1969 Flow Research on Blading 1971 Real Time Control of Electric Power Systems 1973 High Temperature Materials in Gas Turbines 1975 Nonemissive Electrooptic Displays 1977 Current Interruption in High Voltage Networks 1979 Surges in High Voltage Networks 1981 Semiconductor Devices for Power Conditioning 1983 Corrosion in Power Generating Equipment 1985 Computer Systems for Process Control 1987 Process Technologies for Water Treatment The tenth event in an uninterrupted series that by now goes back almost 20 years is a good opportunity to make a few remarks on the guiding rules that have governed our symposia Why have we chosen these titles At the outset we established certain selection criteria we felt that a subject for a symposium should fulfill the following three requirements It should characterize a part of an established discipline in other words it should describe an area of scholarly study and research It should be of current interest in the sense that important results have recently been obtained and considerable research is still being undertaken in the world scientific community It should bear some relation to the scientific and technological activity of the company
