Monolithic Materials F. Svec, T.B. Tennikova, Z. Deyl, 2003-04-29 During the past decade monolithic materials in the shape of discs stacked layers rolled sheets sponges irregular chunks tubes and cylinders have all been successfully demonstrated These formats were prepared from a wide variety of materials including natural polymers such as cellulose synthetic polymers that involved porous styrene methacrylate and acrylamide based polymers and inorganic materials mainly silica Each approach is interesting from the point of view of both preparation and application Although the current papers and patents concerned with monolithic separation media are quite numerous the information is scattered throughout a vast number of journals This book therefore fills the gap in the market for a comprehensive reference book on this subject Monolithic materials concerns all of the current formats of monolithic materials and provides an integrated view of this novel format of separation media Since the flow pattern in monolithic devices is different from that in packed beds the hydrodynamics of the system and mass transport differ considerably from those derived for packed columns Therefore this book presents contributions concerned with both flow and mass transfer in the monolithic materials A significant proportion of the book is devoted to the applications of monolithic materials It also provides the reader with valuable information about the sources of the specific materials their properties and potential applications Monolithic materials are currently very popular within several scientific areas such as chromatography optics catalysis diagnostics genomics proteomics and microfluidics Provides valuable information about the sources of the specific materials their properties and potential applications Chapters written by leading experts in the area
