**The Physics and Chemistry of Carbides, Nitrides and Borides** R. Freer, 2012-12-06 Carbides nitrides and borides are families of related refractory materials Traditionally they have been employed in applications associated with engineering ceramics where either high temperature strength or stability is of primary importance In recent years there has been a growing awareness of the interesting electrical thermal and optical properties exhibited by these materials and the fact that many can be prepared as monolithic ceramics single crystals and thin films In practical terms carbides nitrides and borides offer the prospect of a new generation of semiconductor materials for example which can function at very high temperatures in severe environmental conditions However as yet we have only a limited understanding of the detailed physics and chemistry of the materials and how the preparation techniques influence the properties Under the auspices of the NATO Science Committee an Advanced Research Workshop ARW was held on the Physics and Chemistry of Carbides Nitrides and Borides University of Manchester 18 22 September 1989 in order to assess progress to date and identify the most promising themes and materials for future research An international group of 38 scientists considered developments in 5 main areas The preparation of powders monolithic ceramics single crystals and thin films Phase transformations microstructure defect structure and mass transport Materials stability Theoretical studies Electrical thermal and optical properties of bulk materials and thin films

**Kinetics of Ordering and Growth at Surfaces** Max G. Lagally, 2012-12-06 This volume contains the papers presented at the NATO Advanced Research Workshop on Kinetics of Ordering and Growth at Surfaces held in Acquafredda di Maratea Italy September 18 22 1989 The workshop s goal was to bring together theorists and experimentalists from two related fields surface science and thin film growth to highlight their common interests and overcome a lack of communication between these two communities Typically surface scientists are only concerned with the microscopic atomic description of solids within one monolayer of the surface Thin film growers are usually considered more empirical in their approach concerned primarily with the quality of their product and have not necessarily found it useful to incorporate surface science understanding into their art This workshop aimed to counter at least in some measure these stereotypes Its focus was on generating dialogue on the fundamental structural and kinetic processes that lead to the initial stages of film growth from both the surface science and crystal growth perspectives To achieve this alternate days emphasized the view of surface science and thin film growth with considerable time for discussion a format that appeared to succeed well The success of the workshop is in large measure due to the efforts of the organizing committee L C Feldman P K Larsen J A Venables and J Villain whose advice on the constitution of the program was invaluable

Gupta, 1997-05-05 The rapidly growing area of photonics plays a critical role in many segments of industry such as optical communications

information storage electronic display and other areas and is the subject of intense academic and industrial research The Handbook of Photonics serves as a single source reference book for this exciting field The book is divided into three sections Photonic Materials Photonic Devices and Optics Photonic Systems Each chapter within these sections is written by well known and respected authors and covers the latest information in many of the important aspects of photonics The Handbook of Photonics provides a complete reference for scientists engineers and students working in this field

*Characterization of Semiconductor Heterostructures and Nanostructures* Giovanni Agostini, Carlo Lamberti, 2013-04-11

Characterization of Semiconductor Heterostructures and Nanostructures is structured so that each chapter is devoted to a specific characterization technique used in the understanding of the properties structural physical chemical electrical etc of semiconductor quantum wells and superlattices An additional chapter is devoted to ab initio modeling The book has two basic aims The first is educational providing the basic concepts of each of the selected techniques with an approach understandable by advanced students in Physics Chemistry Material Science Engineering Nanotechnology The second aim is to provide a selected set of examples from the recent literature of the TOP results obtained with the specific technique in understanding the properties of semiconductor heterostructures and nanostructures Each chapter has this double structure the first part devoted to explain the basic concepts and the second to the discussion of the most peculiar and innovative examples The topic of quantum wells wires and dots should be seen as a pretext of applying top level characterization techniques in understanding the structural electronic etc properties of matter at the nanometer and even sub nanometer scale In this respect it is an essential reference in the much broader and extremely hot field of Nanotechnology

Comprehensive collection of the most powerful characterization techniques for semiconductors heterostructures and nanostructures Most of the chapters are authored by scientists that are world wide among the top ten in publication ranking of the specific field Each chapter starts with a didactic introduction on the technique The second part of each chapters deals with a selection of top examples highlighting the power of the specific technique to analyse the properties of semiconductors heterostructures and nanostructures
