Sensory Discrimination Tests and Measurements: Statistical Principles, Procedures and Tables

By *Jian Bi Lou*, USA; Blackwell Publishing Professional, 2006. Pp. 298. ISBN-10:0-8138-1111-2

This book is designed to give readers access to powerful tests, in a unique format that allows for insight into the major statistical directions of sensory research. The timely updates in the various alternatives of discrimination tests are presented in conjunction with a wide variety of tests that were developed during the past decades. It was designed as reference manual for more statistically oriented readers as such it is strongly recommended to research directors, scientists and anybody interested in a profound sensory analysis. A concise description of the contents of the eleven chapters is given below.

Chapter 1. Introduction

An introductory chapter providing a brief overview of standard discrimination methods which are classified according to the decision rules and cognitive strategies involved in the described methods.

Chapter 2. Standard discrimination tests

An interesting approach given in terms of discriminative analysis. This chapter describes six discrimination methods including forced-choice methods and methods with response bias. They are classified under the assumption that consumers in a population are divided into 'discriminator' and 'nondiscriminator' for the products compared and that the laboratory panel has the same discrimination ability. Some numerical examples applying different test statistics that can be used for comparison of two independent proportions are presented.

Chapter 3. Statistical power analysis for standard discrimination tests

The main topic of this chapter is the determination of statistical power for tests, which could contribute to select a suitable test method. It includes calculation of power and sample size (number of judges) for forced-choice methods (2-Alternative Forced Choice, 2-AFC; 3-Alternative Forced Choice, 3-AFC; Triangular and Duo-trio methods), and methods with response bias (A-not A and Same-Different tests) in monadic, mixed and paired designs. Another related issue is the efficiency

comparison of discrimination methods. This comparison is focused on the analysis of an index of sensory difference that will be discussed in detail in chapters 9–10. In addition, related plots and tables are provided. This chapter is poor in terms of sources of references related to the presented equations that are written in the so-called hard statistical manner making it difficult to read by moments.

Chapter 4. Modified discrimination tests

This chapter provides updates on the standard discrimination tests with the purpose of utilising more information increasing the test power. The author introduces two stage models for modified triangle tests: the *Bradley-Harmon* and the *Gridgevan* models, which analyse dichotomised responses about differences between samples. Theory is supported by many examples. The exposed calculations for these modified methods seem to be cumbersome being its application not much viable in the industry field.

Degree of Difference test considering continuous or categorical data, is other modified method based on Same-Different test much more friendly described in this chapter. Another important issue is the so-called *double* discrimination tests as variants of the conventional discrimination methods to avoid the guessing probability and raise the test power (double 2-AFC; double 3-AFC; double Triangular and double Duo-Trio). An interesting approach is the graphical comparison of powers for conventional and modified tests. Finally, the present chapter also includes a modified preference test with the appropriate statistical treatment of 'no preference' option.

Chapter 5. Multiple-sample discrimination tests

This chapter restricts the attention to the comparison of more than two samples in practice. This topic has relevance because comparison of multiple proportions is often used in sensory and consumer research. Some useful statistical models for the resolution of multiple-sample tests are discussed. The chapter summarises the calculation of specific statistics in order to establish significant differences between independent or matched proportions (Cochran's Q-test). Other described tests are ranks of intensity or preference method (Friedman rank sum test, Durbin, Anderson and Taplin statistics, the Bradley-Terry model) and categorical scale method (Pearson's chi-square test, Generalized Stuart-Maxwell test). The reader receives a wide variety of tests with
