Functional Biology of Plants. By M. J. Hodson and J. A. Bryant. Chichester, UK: Wiley-Blackwell (2012), pp. 326, £34.99. ISBN 978-0-470-69939-3.

Martin Hodson and John Bryant have written the most captivating and elementary textbook on modern plant biology. It might be read from cover to cover by anyone seeking an introduction to the subject, but seems especially suited to high school, undergraduate and vocational courses. The book begins with an excellent synopsis of the evolution of plants, and then describes the biochemistry of plant cells, the control of gene expression and the processes of plant development from embryo to establishment. This is followed by chapters revealing the ontogeny, structure and functions of roots, stems, leaves and flowers, their associations with beneficial organisms and their responses to environmental cues. The acclimation and adaptation of plants to abiotic stresses, including extreme temperatures, waterlogging and drought, salinity and exposure to various pollutants, and their interactions with other plants, herbivores and pathogens are then considered. The book concludes with the authors' thoughts on plants and climate change, the conservation of biodiversity and the importance of crops for global energy and food security. The text is perfectly articulated and referenced both within and between chapters. The further reading is enticing and not intimidating. The book is illustrated with colour photographs of the plants referred to in the text and simple figures suitable for teaching. There is a glossary of common terms and a useful index. I did not notice many mistakes, but, since I am fond of the Nernst equation, I will mention that 2.303 (RT/zF) is not always 59 (p. 134). This might be explained in a future edition.

Crop Plant Anatomy. By R. Maity, P. Satya, D. Rajkumar and A. Ramaswamy. Wallingford, UK: CABI (2012), pp. 317, £75.00. ISBN 978-1-78064-019-8.

This book is divided into four parts. The first part provides a general introduction to plant anatomy, the techniques employed by plant anatomists and the importance of the study of plant anatomy to modern plant science. The second part presents specific information on major cereal (rice, maize, wheat, sorghum, pearl millet), pulse (chickpea, common bean, green gram, pigeonpea, cowpea, pea), oil (sunflower, peanut, mustard, sesame, castor), fibre (cotton, jute, kenaf, flax, ramie, hemp, sunhemp) and vegetable (tomato, chills, aubergine, okra, watermelon, bottle gourd, bitter melon, cucumber, luffa, sponge gourd, cabbage, coriander) crops. Sections on each crop begin with its botanical classification, evolutionary origin and history of domestication, current production and uses. This is followed by descriptions of the morphologies of the vegetative and flowering plant, and then (for most crops) descriptions of the anatomy of roots, stems, leaves, floral organs and seeds or fruits. The anatomy of cotton bolls and the stems of bast fibre crops are described in detail. Specific attention is paid to the roles of trichomes in insect resistance and leaf anatomy in drought tolerance. The third part considers anatomical adaptations that help plants resist pests and pathogens or tolerate drought or waterlogging. Here, the functions of trichomes, cuticular waxes, silicification, lignification, suberization, and the formation of aerenchyma are discussed. The final part speculates how crop productivity might be increased by, for example engineering Kranz anatomy in C3 crops to improve photosynthetic efficiency, manipulating nodulation to increase nitrogen-fixation or altering floral structures to improve pollination efficiency.
