Ridges In Image And Data Analysis:

Ridges in Image and Data Analysis D. Eberly, 2012-12-06 The concept of ridges has appeared numerous times in the image processing literature Sometimes the term is used in an intuitive sense Other times a concrete definition is provided In almost all cases the concept is used for very specific applications When analyzing images or data sets it is very natural for a scientist to measure critical behavior by considering maxima or minima of the data These critical points are relatively easy to compute Numerical packages always provide support for root finding or optimization whether it be through bisection Newton's method conjugate gradient method or other standard methods It has not been natural for scientists to consider critical behavior in a higher order sense The concept of ridge as a manifold of critical points is a natural extension of the concept of local maximum as an isolated critical point However almost no attention has been given to formalizing the concept There is a need for a formal development There is a need for understanding the computation issues that arise in the implementations The purpose of this book is to address both needs by providing a formal mathematical foundation and a computational framework for ridges The intended audience for this book includes anyone interested in exploring the usefulness of ridges in data analysis

Ridges in Image and Data Analysis D Eberly, 1996-09-30 This book provides a thorough development of ridges and their application to image and data analysis The text is self contained by including a chapter on the necessary mathematical background chapters on the formal ridge definitions in any geometric setting and a chapter on the numerical implementation An applications chapter covers three separate topics medical image analysis molecular modeling and analysis of fluid flow Audience The book is intended primarily for computer vision and image processing scientists with a background in mathematics and scientific computation However ridges provide a general purpose tool for multidimensional data analysis so the book will be of interest to practitioners in any field which requires the analyzing of data such as statistics the physical sciences or engineering

Developments in the Visualization and Processing of Tensor Fields David H. Laidlaw, Anna Vilanova, 2012-09-14 Bringing together key researchers in disciplines ranging from visualization and image processing to applications in structural mechanics fluid dynamics elastography and numerical mathematics the workshop that generated this edited volume was the third in the successful Dagstuhl series Its aim reflected in the quality and relevance of the papers presented was to foster collaboration and fresh lines of inquiry in the analysis and visualization of tensor fields which offer a concise model for numerous physical phenomena Despite their utility there remains a dearth of methods for studying all but the simplest ones a shortage the workshops aim to address Documenting the latest progress and open research questions in tensor field analysis the chapters reflect the excitement and inspiration generated by this latest Dagstuhl workshop held in July 2009 The topics

they address range from applications of the analysis of tensor fields to purer research into their mathematical and analytical properties They show how cooperation and the sharing of ideas and data between those engaged in pure and applied research can open new vistas in the study of tensor fields

Topology-Based Methods in Visualization II Hans-Christian Hege, Konrad Polthier, Gerik Scheuermann, 2009-02-07 Visualization research aims to provide insight into large complicated data sets and the phenomena behind them While there are different methods of reaching this goal topological methods stand out for their solid mathematical foundation which guides the algorithmic analysis and its presentation Topology based methods in visualization have been around since the beginning of visualization as a scientific discipline but they initially played only a minor role In recent years interest in topology based visualization has grown and significant innovation has led to new concepts and successful applications The latest trends adapt basic topological concepts to precisely express user interests in topological properties of the data This book is the outcome of the second workshop on Topological Methods in Visualization which was held March 4-6 2007 in Kloster Nimbschen near Leipzig Germany The workshop brought together more than 40 international researchers to present and discuss the state of the art and new trends in the field of topology based visualization Two inspiring invited talks by George Haller MIT and Nelson Max LLNL were accompanied by 14 presentations by participants and two panel discussions on current and future trends in visualization research This book contains thirteen research papers that have been peer reviewed in a two stage review process In the first phase submitted papers were peer reviewed by the international program committee After the workshop accepted papers went through a revision and a second review process taking into account comments from the first round and discussions at the workshop About half the papers concern topology based analysis and visualization of fluid flows simulations two papers concern more general topological algorithms while the remaining papers discuss topology based visualization methods in application areas like biology medical imaging and electromagnetism

Topological Methods in Data Analysis and Visualization II Ronald Peikert, Helwig Hauser, Hamish Carr, Raphael Fuchs, 2012-01-10 When scientists analyze datasets in a search for underlying phenomena patterns or causal factors their first step is often an automatic or semi automatic search for structures in the data Of these feature extraction methods topological ones stand out due to their solid mathematical foundation Topologically defined structures as found in scalar vector and tensor fields have proven their merit in a wide range of scientific domains and scientists have found them to be revealing in subjects such as physics engineering and medicine Full of state of the art research and contemporary hot topics in the subject this volume is a selection of peer reviewed papers originally presented at the fourth Workshop on Topology Based Methods in Data Analysis and Visualization TopoInVis 2011 held in Zurich Switzerland The workshop brought together many of the leading lights in the field for a mixture of formal presentations and discussion One topic currently generating a

great deal of interest and explored in several chapters here is the search for topological structures in time dependent flows and their relationship with Lagrangian coherent structures Contributors also focus on discrete topologies of scalar and vector fields and on persistence based simplification among other issues of note The new research results included in this volume relate to all three key areas in data analysis theory algorithms and applications
