*A Study of Business Decisions Under Uncertainty* Andreas Stark, 2010-07 This dissertation will discuss the uncertainty encountered in the daily operations of businesses The concepts will be developed by first giving an overview of probability and statistics as used in our everyday activities such as the basic principles of probability univariate and multivariate statistics data clustering and mapping as well as time sequence and spectral analysis The examples used will be from the oil and gas exploration industry because the risks taken in this industry are normally quite large and are ideal for showing the application of the various techniques for minimizing risk Subsequently the discussion will deal with basic risk analysis spatial and time variations of risk geotechnical risk analysis risk aversion and how it is affected by personal biases and how to use portfolios to hedge risk together with the application of real options Next fractal analysis and its application to economics and risk analysis will be examined followed by some examples showing the change in the Value at Risk under Fractal Brownian Motions Finally a neural network application is shown whereby some of these risks and risk factors will be combined to forecast the best possible outcome given a certain knowledge base The chapters will discuss Basic probability techniques and uncertainty principles Analysis and diversification for exploration projects The value and risk of information in the decision process Simulation techniques and modeling of uncertainty Project valuation and project risk return Modeling risk propensity or preference analysis of exploration projects Application of fractals to risk analysis Simultaneous prediction of strategic risk and decision attributes using multivariate statistics and neural networks

**Reservoir Management** Steve Cannon, 2021-03-22 Reservoir management is fundamental to the efficient and responsible means of extracting hydrocarbons and maximising the economic benefit to the operator licence holders and central government All stakeholders have a social responsibility to protect the local population and environment The process of managing an oil or gas reservoir begins after discovery and continues through appraisal development production and abandonment there is cost associated with each phase and a series of decision gates should be in place to ensure that an economic benefit exists before progress is made To correctly establish potential value at each stage it is necessary to acquire and analyse data from the subsurface the planned surface facilities and the contractual obligations to the end user of the hydrocarbons produced This is especially true of any improved recovery methods proposed or plans to extend field life To achieve all the above requires a multi skilled team of professionals working together with a clear set of objectives and associated rewards The team s make up will change over time as different skills are required as will the management of the team with geoscientists engineers and commercial analysts needed to address the issues as they arise This book is designed as a guide for non specialists involved in the process of reservoir management which is often treated as a task for reservoir engineers alone it is a task for all the disciplines involved in turning a exploration success into a commercial asset Most explorers earn their bonus based on the initial estimates of in place hydrocarbons regardless of the ultimate cost of production the explorers have usually moved on to a new basin before the first oil or gas is produced This book is not a deeply academic tome rather the description of a process enlivened by a number of stories and case studies from the author s forty years of experience in the oil patch
