The background of the cover is an abstract, colorful illustration. It features a large, multi-colored spiral in the lower half, with concentric rings of blue, orange, and green. Above the spiral, there are several red circles with black dots inside, arranged in a curved path. The overall style is vibrant and artistic, suggesting a complex, dynamic system.

Methods For Cyber-physical-cognitive Systems Vladimir G Ivancevic,Darryn J Reid,Michael J Pilling,2017-10-30

Mathematics of Autonomy provides solid mathematical foundations for building useful Autonomous Systems It clarifies what

makes a system autonomous rather than simply automated and reveals the inherent limitations of systems currently incorrectly labeled as autonomous in reference to the specific and strong uncertainty that characterizes the environments they operate in. Such complex real world environments demand truly autonomous solutions to provide the flexibility and robustness needed to operate well within them. This volume embraces hybrid solutions to demonstrate extending the classes of uncertainty autonomous systems can handle. In particular it combines physical autonomy robots cyber autonomy agents and cognitive autonomy cyber and embodied cognition to produce a rigorous subset of trusted autonomy Cyber Physical Cognitive autonomy CPC autonomy. The body of the book alternates between underlying theory and applications of CPC autonomy including Autonomous Supervision of a Swarm of Robots Using Wind Turbulence against a Swarm of UAVs and Unique Super Dynamics for All Kinds of Robots UAVs UGVs UUVs and USVs to illustrate how to effectively construct Autonomous Systems using this model. It avoids the wishful thinking that characterizes much discussion related to autonomy discussing the hard limits and challenges of real autonomous systems. In so doing it clarifies where more work is needed and also provides a rigorous set of tools to tackle some of the problem space.

Model Induction from Data Y.B. Dibike, 2002-01-01 There has been an explosive growth of methods in recent years for learning or estimating dependency from data where data refers to known samples that are combinations of inputs and corresponding outputs of a given physical system The main subject addressed in this thesis is model induction from data for the simulation of hydrodynamic processes in the aquatic environment Firstly some currently popular artificial neural network architectures are introduced and it is then argued that these devices can be regarded as domain knowledge incapsulators by applying the method to the generation of wave equations from hydraulic data and showing how the equations of numerical hydraulic models can in their turn be recaptured using artificial neural networks The book also demonstrates how artificial neural networks can be used to generate numerical operators on non structured grids for the simulation of hydrodynamic processes in two dimensional flow systems and a methodology has been derived for developing generic hydrodynamic models using artificial neural network The book also highlights one other model induction technique namely that of support vector machine as an emerging new method with a potential to provide more robust models
