Computational Modelling in Behavioural Neuroscience Dietmar Heinke,Eirini Mavritsaki,2009-04-03 Classically behavioural neuroscience theorizes about experimental evidence in a qualitative way However more recently there has been an increasing development of mathematical and computational models of experimental results and in general these models are more clearly defined and more detailed than their qualitative counter parts These new computational models can be set up so that they are consistent with both single neuron and whole system levels of operation allowing physiological results to be meshed with behavioural data thus closing the gap between neurophysiology and human behaviour There is considerable diversity between models with respect to the methodology of designing a model the degree to which neurophysiological processes are taken into account and the way data behavioural electrophysiological etc constrains a model This book presents examples of this diversity and in doing so represents the state of art in the field through a unique collection of papers from the world s leading researchers in the area of computational modelling in behavioural neuroscience Based on talks given at the third Behavioural Brain Sciences Symposium held at the Behavioural Brain Sciences Centre University of Birmingham in May 2007 the book appeals to a broad audience from postgraduate students beginning to work in the field to

properties Although research in Neuromechanics is not limited by computational approaches neuromechanical modeling is a
powerful tool that allows for integration of massive knowledge gained in the past several decades in organization of motion
related brain and spinal cord activity various body sensors and reflex pathways muscle mechanical and physiological
properties and detailed quantitative morphology of musculoskeletal systems Recent work in neuromechanical modeling has
demonstrated advantages of such an integrative approach and led to discoveries of new emergent properties of
neuromechanical systems Neuromechanical Modeling of Posture and Locomotion will cover a wide range of topics from
theoretical studies linking the organization of reflex pathways and central pattern generating circuits with morphology and
mechanics of the musculoskeletal system Burkholder Nichols Shevtsova et al to detailed neuromechanical models of postural
