Neuronal Regeneration Reorganization And Repair:

Restorative Neurology of Spinal Cord Injury Milan R. Dimitrijevic, 2012-01-12 Following injury or disease neural circuitry can be altered to varying degrees leading to highly individualized characteristics that may or may not resemble original function In addition lost or partially damaged circuits and the effects of biological recovery processes coupled with learned compensatory strategies create a new neuroanatomy with capabilities that are often not functional or may interfere with daily life To date the majority of approaches used to treat neurological dysfunction have focused on the replacement of lost or damaged function usually through the suppression of surviving neural activity and the application of mechanical assistive devices Restorative Neurology of Spinal Cord Injury offers a different and novel approach Focusing on the spinal cord and its role in motor control the book details the clinical and neurophysiological assessment process and methods developed throughout the past half century by basic and clinical scientists Then through the use of specialized clinical and neurophysiological testing methods conduction and processing performed within the surviving neural circuitry is examined and characterized in detail Based on the results of such assessment treatment strategies also described in this book are applied to augment rather than replace the performance of surviving neural circuitry and improve the functional capacity of people who have experienced injury to their spinal cords

Spinal Cord Plasticity Michael M. Patterson, James W. Grau, 2011-06-28 The area of spinal cord plasticity has become a

very actively researched field The spinal cord has long been known to organize reflex patterns and serve as the major transmission pathway for sensory and motor nerve impulses However the role of the spinal cord in information processing and in experience driven alterations is generally not recognized With recent advances in neural recording techniques behavioral technologies and neural tracing and imaging methods has come the ability to better assess the role of the spinal cord in behavioral control and alteration The discoveries in recent years have been revolutionary Alterations due to nociceptive inputs simple learning paradigms and repetitive inputs have now been documented and their mechanisms are being elucidated These findings have important clinical implications The development of pathological pain after a spinal cord injury likely depends on the sensitization of neurons within the spinal cord The capacity of the spinal cord to change as a function of experience and adapt to new environmental relations also affects the recovery locomotive function after a spinal cord injury Mechanisms within the spinal cord can support stepping and the capacity for this behavior depends on behavioral training By taking advantage of the plasticity inherent within the spinal cord rehabilitative procedures may foster the recovery of function
