Structural Materials in Nuclear Power Systems J. T. Adrian Roberts, 2013-03-09 In recent years the effort devoted to assuring both the safety and reliability of commercial nuclear fission power reactors has markedly increased The incentives for performing this work are large since the resulting improvement in plant productivity translates into lower fuel costs and more importantly reduced reliance on imported oil Reliability and availability of nuclear power plants whether fission or fusion demand that more attention be focused on the behavior of materials Recent experiences with fission power indicate that the basic properties of materials which categorize their reliable behavior under specified conditions need reinforcement to assure trouble free operation for the expected service life The pursuit of additional information continues to demand a better understanding of some of the observed anomalous behavior and of the margin of resistance of materials to unpredictable service conditions It is also apparent that next to plasma heating and confinement materials selection represents the most serious challenge to the introduction of fusion power The recognition of the importance of materials performance to nuclear plant performance has sustained a multimillion dollar worldwide research and development effort that has yielded significant results both in quantification of the performance limits of materials in current use and the development and qualification of new materials Most of this information appears in the open literature in the form of research reports journal articles and conference proceedings
