Proceedings of the 10th International Symposium on Insect-Plant Relationships Stephen J. Simpson, A. Jennifer Mordue, Jim Hardie, 2014-01-15 *Proceedings of the 10th International Symposium on Insect-Plant Relationships* Stephen J. Simpson, A. Jennifer Mordue, Jim Hardie, 2013-04-17 Over the past 40 years the SIP meetings have played a central role in the development of the field of insect plant relationships providing both a show case for current research as well as a forum for the airing and development of influential new ideas The 10th symposium held 4-10 July 1998 in Oxford followed that tradition The present volume includes a representative selection of fully refereed papers from the meeting plus a listing of the titles of all presentations The volume includes reviews of major areas within the subject along with detailed experimental studies Topics covered include central neural and chemosensory bases of host plant recognition integrative studies of insect behaviour tritrophic interactions plant defences insect life histories plant growth responses microbial partners in insect plant associations and genetic bases of host plant associations The book provides a key source for students and research workers in the field of insect plant relationships

Schoonhoven, 2013-06-29 The 11th International Symposium on Insect Plant Relationships SIP11 held on August 4-10 2001 in Helsingør Denmark followed the tradition of previous SIP meetings and covered topics of different levels from chemistry physiology and ethology to ecology genetics and evolution of insect plant relationships The present volume includes a representative selection of fully refereed papers as well as a complete list of all the contributions which were presented at the meeting Reviews of selected topics as well as original experimental data are included The book provides valuable information for students and research workers interested in chemical and biological aspects of interactions between individuals and populations of different organisms Insect-Plant Biology Louis M. Schoonhoven, Joop J. A. van Loon, Marcel Dicke, 2005-12 Half of all insect species are dependent on living plant tissues consuming about 10% of plant annual production in natural habitats and an even greater percentage in agricultural systems despite sophisticated control measures Plants are generally remarkably well protected against insect attack with the result that most insects are highly specialized feeders The mechanisms underlying plant resistance to invading herbivores on the one side and insect food specialization on the other are the main subjects of this book For insects these include food plant selection and the complex sensory processes involved with their implications for learning and nutritional physiology as well as the endocrinological aspects of life cycle synchronization with host plant phenology In the case of plants exposed to insect herbivores they include the activation of defence systems in order to minimize damage as well as the emission of chemical signals that may attract natural enemies of the invading herbivores and may be exploited by neighbouring plants that mount defences as well Insect Plant Biology

discusses the operation of these mechanisms at the molecular and organismal levels in the context of both ecological interactions and evolutionary relationships. In doing so it uncovers the highly intricate antagonistic and mutualistic interactions that have evolved between plants and insects. The book concludes with a chapter on the application of our knowledge of insect-plant interactions to agricultural production. This multidisciplinary approach will appeal to students in agricultural entomology, plant sciences, ecology and indeed anyone interested in the principles underlying the relationships between the two largest groups of organisms on earth: plants and insects. **BOOK JACKET Title Summary** field provided by Blackwell North America Inc. Crop Traits for Defense Against Pests and Disease: Durability, Breakdown and Future Prospects, 2nd Edition Alison J. Karley, Scott N. Johnson, Rex Brennan, Peter J. Gregory, 2019-04-17 With global populations expected to exceed 9.2 billion by 2050 and available land and water resources devoted to crop production dwindling, we face significant challenges to secure global food security. Only 12 plant species feed 80% of the world's population, with just three crop species: wheat, rice, and maize accounting for food consumed by 50% of the global population. Annual losses to crop pests and pathogens are significant, thought to be equivalent to that required to feed a billion people at a time when crop productivity has plateaued. With pesticide applications becoming increasingly unfeasible on cost, efficacy, and environmental grounds, there is growing interest in exploiting plant resistance and tolerance traits for crop protection. Indeed, mankind has been selectively breeding plants for desirable traits for thousands of years. However, resistance and tolerance traits have not always been those most desired, and in many cases have been inadvertently lost during the domestication process. Crops have been effectively disarmed by domestication. Moreover, mechanistic understanding of how resistance and tolerance traits operate is often incomplete, which makes identifying the right combination for crop protection difficult. We aimed to address this Research Topic by inviting authors to contribute their knowledge of appropriate resistance and tolerance traits, explore what is known about durability and breakdown of defensive traits, and finally asking what are the prospects for exploiting these traits for crop protection. The research topic summarised in this book addresses some of the most important issues in the future sustainability of global crop production.

Climate Change and Crop Stress Arun K. Shanker, Chitra Shanker, Anjali Anand, M. Maheswari, 2021-11-19 Climate Change and Crop Stress: Molecules to Ecosystems expounds on the transitional period where science has progressed to post-genomics and the gene editing era, putting field performance of crops to the

forefront and challenging the production of practical applicability vs theoretical possibility Researchers have concentrated efforts on the effects of environmental stress conditions such as drought heat salinity cold or pathogen infection which can have a devastating impact on plant growth and yield Designed to deliver information to combat stress both in isolation and through simultaneous crop stresses this edited compilation provides a comprehensive view on the challenges and impacts of simultaneous stresses Presents a multidisciplinary view of crop stresses empowering readers to quickly align their individual experience and perspective with the broader context Combines the mechanistic aspects of stresses with the strategic aspects Presents both abiotic and biotic stresses in a single volume

Biological Control of Weeds in Australia Jim Cullen, Mic Julien, Rachel McFadyen, 2012-03-05 Biological control of weeds has been practised for over 100 years and Australia has been a leader in this weed management technique The classical example of control of prickly pears in Australia by the cactus moth *Cactoblastis cactorum* which was imported from the Americas helped to set the future for biocontrol of weeds in many countries Since then there have been many projects using Classical Biological Control to manage numerous weed species many of which have been successful Importantly there have been no serious negative non target impacts the technique when practised as it is in Australia is safe and environmentally friendly Economic assessments have shown that biocontrol of weeds in Australia has provided exceedingly high benefit to cost ratios This book reviews biological control of weeds in Australia to 2011 covering over 90 weed species and a multitude of biological control agents and potential agents Each chapter has been written by practising biological control of weeds researchers and provides details of the weed the history of its biological control exploration for agents potential agents studied and agents released and the outcomes of those releases Many weeds were successfully controlled some were not many projects are still underway some have just begun however all are reported in detail in this book Biological Control of Weeds in Australia will provide invaluable information for biological control researchers in Australia and elsewhere Agents used in Australia could be of immense value to other countries that suffer from the same weeds as Australia The studies reported here provide direction to future research and provide examples and
