Horne, C. Lee Giles, 1995 Abstract We present two approaches to the analysis of the relationship between a recurrent neural network RNN and the finite state machine M the network is able to exactly mimic First the network is treated as a state machine and the relationship between the RNN and M is established in the context of algebraic theory of automata In the second approach the RNN is viewed as a set of discrete time dynamical systems associated with input symbols of M In particular issues concerning network representation of loops and cycles in the state transition diagram of M are shown to provide a basis for the interpretation of learning process from the point of view of bifurcation analysis The circumstances under which a loop corresponding to an input symbol x is represented by an attractive fixed point of the underlying dynamical system associated with x are investigated For the case of two recurrent neurons under some assumptions on weight values bifurcations can be understood in the geometrical context of intersection of increasing and decreasing parts of curves defining fixed points The most typical bifurcation responsible for the creation of a new fixed point is the saddle node bifurcation **A Field Guide to Dynamical Recurrent Networks** John F. Knowledge-based Neurocomputing Ian Cloete, Jacek M. Zurada, 2000 Looking at ways to encode prior knowledge and to extract refine and revise knowledge within a neurocomputing system Neurocomputing methods are loosely based on a model of the brain as a network of simple interconnected processing elements corresponding to neurons These methods derive their power from the collective processing of artificial neurons the chief advantage being that such systems can learn and adapt to a changing environment In knowledge based neurocomputing the emphasis is on the use and representation of knowledge about an application Explicit modeling of the knowledge represented by such a system remains a major research topic The reason is that humans find it difficult to interpret the numeric representation of a neural network The key assumption of knowledge based neurocomputing is that knowledge is obtainable from or can be represented by a neurocomputing system in a form that humans can understand That is the knowledge embedded in the neurocomputing system can also be represented in a symbolic or well structured form such as Boolean functions automata rules or other familiar ways The focus of knowledge based computing is on methods to encode prior knowledge and to extract refine and revise knowledge within a neurocomputing system Contributors C Aldrich J Cervenka I Cloete R A Cozzio R Drossu J Fletcher C L Giles F S Gouws M Hilario M Ishikawa A Lozowski Z Obradovic C W Omlin M Riedmiller P Romero G P J Schmitz J Sima A Sperduti M Spott J Weisbrod J M Zurada
