## **Neural Network Data Analysis Using Simulnet:**

Neural Network Data Analysis Using SimulnetTM Edward J. Rzempoluck,2012-12-06 Scope of this Text This text is intended to provide the reader with an introduction to the analysis of numerical data using neural networks Neural networks as data analytic tools allow data to be analyzed in order to discover and model the functional relationships among the recorded variables Such data may be empirical It may originate in an experiment in which the values of one or more dependent variables are recorded as one or more independent variables are manipulated Alternatively the data may be observational rather than empirical in nature representing historical records of the behavior of some set of variables An example would be the values of a number of financial commodities such as stocks or bonds Finally the data may originate in a computational model of some physical process Instead of recording variables of the physical process the computer model could be run to generate an artificial analog of the physical data Since data in virtually any native form can be expressed in numerical format the scope of the analytical techniques and procedures that will be presented in this text is essentially unlimited Sources of data include research work in a range of disciplines as diverse as neuroscience biomedicine geophysics psychology sociology archeology economics and astrophysics An often fruitful approach to data analysis involves the use of neural network functions

Network Simulation Environments describes some of the best examples of neural simulation environments All current neural simulation tools can be classified into four overlapping categories of increasing sophistication in software engineering The least sophisticated are undocumented and dedicated programs developed to solve just one specific problem these tools cannot easily be used by the larger community and have not been included in this volume The next category is a collection of custom made programs some perhaps borrowed from other application domains and organized into libraries sometimes with a rudimentary user interface More recently very sophisticated programs started to appear that integrate advanced graphical user interface and other data analysis tools These are frequently dedicated to just one neural architecture algorithm as for example three layers of interconnected artificial neurons learning to generalize input vectors using a backpropagation algorithm Currently the most sophisticated simulation tools are complete system level environments incorporating the most advanced concepts in software engineering that can support experimentation and model development of a wide range of neural networks These environments include sophisticated graphical user interfaces as well as an array of tools for analysis manipulation and visualization of neural data Neural Network Simulation Environments is an excellent reference for researchers in both academia and industry and can be used as a text for advanced courses on the subject
