Lucerna, F.M. Salpietro, C. Alafaci, F. Tomasello, 2012-12-06 In the first half of the twentieth century the study of neuroanatomy was essentially based on the observations made by scientists on brain cadavers fixed with standard techniques These studies have produced well known tools such as the stereotactic atlas which have proven to be extremely useful and irreplaceable for neurosurgeons neuroradiologists neurologists and neuroanatomists In particular the Talairach and Schaltenbrandt atlases are considered the most prestigious and up to date work available today The recent introduction of neuroimaging especially nuclear magnetic resonance together with the exciting and tremendous progress made in computer graphics has allowed us to approach neuroanatomy directly in living patients with more accuracy and a high degree of detail This work after a short introduction which explains the methodology used is divided into four types of sections three types of sections obtained from the same brain and orientated in the standard axial sagittal and coronal spatial planes and one type of section of three dimensional pictures obtained from the computerized processing of the previous pictures The organization and the life size tables obtained by magnetic resonance make this work similar to a classic stereotactic atlas although the authors do not claim to reach the high level of precision which such atlases usually provide The abbreviations used are based on Latin nomenclature in order to be understood and recognized world wide and are supported by a system of color codes useful for the identification of brain structures
