Animal Models of Speech and Language Disorders Santosh A. Helekar, 2013-10-17 Basic research over the last decade or two has uncovered similarities between speech especially its sensori motor aspects and vocal communication in several non human species The most comprehensive studies so far have been conducted in songbirds Songbirds offer us a model system to study the interactions between developmental or genetic predispositions and tutor dependent influences on the learning of vocal communication Songbird research has elucidated cellular and molecular mechanisms underlying learning and production of vocal patterns perception of vocal sounds vocal motor control and vocal neuromotor plasticity More recently the entire genome of the songbird zebra finch has been sequenced These discoveries along with the identification of several genes implicated in familial human speech and language disorders have made it possible to look for analogues of speech and language dysfunction in zebra finches at least at the perceptual and sensori motor levels Two approaches in particular have led us closer to the development of animal models of human speech conditions namely developmental stuttering and a familial verbal dyspraxia associated with a mutation in the gene for the transcription factor FoxP2 Work on other animals that show developmental sensori motor learning of vocal sounds used for communication have also shown significant progress leading to the possibility of development of models of speech and language dysfunction in them Among mammals the principal ones include dolphins and whales In non human primates while vocal learning per se is not very prominent investigations on their communicative abilities have thrown some light on the rudiments of language These considerations make the publication of a book focused on animal models of speech and language disorders detailing the overall investigative

approach of neurobehavioral studies in animals capable of vocal communication and learned vocalizations a much needed and worthwhile project It would serve as a unifying review of research in this new multidisciplinary frontier spanning the molecular to the behavioral for clinicians and researchers as well as a teaching resource for advanced speech pathology and neuroscience students This book will also be the first of its kind Memory for Odors Frank R. Schab, Robert G. Crowder, 2014-02-04 The power of odors to unlock human memory is celebrated in literature and anecdote but poorly documented by science Odors perhaps more than other stimuli are widely believed to evoke vivid and complex past experiences easily Yet in contrast to the frequency with which odors are thought to evoke memories of the past scientific evidence is thus far scant For years voluminous data have been collected on odor sensitivity whereas relatively few studies exist on memory for odors per se Moreover the memory data that do exist are thus far only poorly integrated with the most modern attitudes on human memory The major goal of this volume is to point the way toward a better state of affairs one in which the study of odor memory is legitimized as a proper specialization and is informed by the most promising ideas in the mainstream study of memory This volume explores three tendencies in modern memory theory that have not yet sufficiently penetrated the odor memory work memory coding memory and knowledge and implicit and explicit memory
