

Chapter 3: Biology & Neuroscience

3.1 Introduction: The Smart Conduit

- Your nervous system is the main interpreter of both the events in your body and those in the outer world. Your brain and spinal cord are the ultimate problem solvers that send and receive information to and from all areas of your body, and your nervous system is a maze of complex cellular networks that relay and process information.
- This integrated set of networks is composed of specialized cells called neurons (cells that transmit electrical impulses) and glial cells that provide support functions.
- ***Glial cells:* Several different kinds of helper cells that assist neurons in their role as the brain's communicators and provide structural support.**
- ***Neural:* Anything related to nervous system structure or function.**

3.2 Cells of the Nervous System

- There are two main types of cells in the nervous system. Neurons act as the main communicators. The second type of cell are called glia; they perform numerous support functions in the nervous system.

3.2.1 Neurons

- Neuron: Cells that communicate within the brain and with the body to form thoughts and actions. These cells code information as electrical signals, and also release chemicals that influence other neurons/organs/body parts.
- Neurons communicate with each other through chemical messages that alter the electrical activity of other neurons

3.2.1.1 Dendrites Receive Messages

- Dendrites are extensions of the membrane of the cell body and they receive chemical messages from many other neurons
- the chemical signal (called a neurotransmitter) influences action in the neuron. It can tell the neuron to "activate" (excitation) or "quiet down" (inhibition)

Preventing Chemical Weapons Michael Crowley, Malcolm Dando, Lijun Shang, 2018-08-20 The life and chemical sciences are in the midst of a period of rapid and revolutionary transformation that will undoubtedly bring societal benefits but also have potentially malign applications notably in the development of chemical weapons Such concerns are exacerbated by the unstable international security environment and the changing nature of armed conflict which could fuel a desire by certain States to retain and use existing chemical weapons as well as increase State interest in creating new weapons whilst a broader range of actors may seek to employ diverse toxic chemicals as improvised weapons Stark indications of the multi faceted dangers we face can be seen in the chemical weapons attacks against civilians and combatants in Iraq and Syria and also in more targeted chemical assassination operations in Malaysia and the UK Using a multi disciplinary approach and drawing upon an international group of experts this book analyses current and likely near future advances in relevant science and technology assessing the risks of their misuse The book examines the current capabilities limitations and failures of the existing international arms control and disarmament architecture notably the Chemical Weapons Convention in preventing the development and use of chemical weapons Through the employment of a novel Holistic Arms Control methodology the authors also look beyond the bounds of such treaties to explore the full range of international law international agreements and regulatory mechanisms potentially applicable to weapons employing toxic chemical agents in order to develop recommendations for more effective routes to combat their proliferation and misuse A particular emphasis is given to the roles that chemical and life scientists health professionals and wider informed activist civil society can play in protecting the prohibition against poison and chemical weapons and in working with States to build effective and responsive measures to ensure that the rapid scientific and technological advances are safeguarded from hostile use and are instead employed for the benefit of us all
