Principles Of Mental Imagery Bradfords:

Principles of Mental Imagery Ronald A. Finke, 1989 Principles Of Mental Imagery offers a broad balanced and up to date introduction to the major findings of this research and identifies five general principles that can account for most of them It considers the development of experimental techniques that have solved many of the challenging methodological problems inherent in imagery research and includes recent experimental findings not covered in other imagery books *Case Studies in the Neuropsychology of Vision* Glyn W. Humphreys, 2013-04-15 One important means to understanding normal cognitive functions is the study of the breakdown of these functions following brain damage This book provides reviews of major case studies dealing with the breakdown of visual perception and recognition including the disorders of motion vision colour vision perceptual integration perceptual classification recognition of particular categories of object semantic access from vision in optic aphasia and recognition impairments with relative sparing of imagery The cases are discussed in the light of studies that have followed since and the chapters provide a context in which the contributions of the case studies can be evaluated

Physics of the Human Temporality Ihor Lubashevsky, Natalie Plavinska, 2021-10-21 This book presents a novel account of the human temporal dimension called the human temporality and develops a special mathematical formalism for describing such an object as the human mind One of the characteristic features of the human mind is its temporal extent For objects of physical reality only the present exists which may be conceived as a point like moment in time In the human temporality the past retained in the memory the imaginary future and the present coexist and are closely intertwined and impact one another This book focuses on one of the fragments of the human temporality called the complex present A detailed analysis of the classical and modern concepts has enabled the authors to put forward the idea of the multi component structure of the present For the concept of the complex present the authors proposed a novel account that involves a qualitative description and a special mathematical formalism This formalism takes into account human goal oriented behavior and uncertainty in human perception The present book can be interesting for theoreticians physicists dealing with modeling systems where the human factor plays a crucial role philosophers who are interested in applying philosophical concepts to constructing mathematical models and psychologists whose research is related to modeling mental processes

Journal of Mental Imagery, 1993 *Discourse, Vision, and Cognition* Jana Holňánová, 2008 While there is a growing body of psycholinguistic experimental research on mappings between language and vision on a word and sentence level there are almost no studies on how speakers perceive conceptualise and spontaneously describe a complex visual scene on higher levels of discourse This book explores the relationship between language eye movements and cognition and brings together discourse analysis with cognitively oriented behavioral research Based on the analysis of data drawn from spoken descriptive discourse spontaneous conversation and experimental investigations this work offers a comprehensive picture of the dynamic natures of language vision and mental imagery Verbal and visual data synchronised and correlated by means of a multimodal scoring

method are used as two windows to the mind to show how language and vision in concert can elucidate covert mental processes

Recreative Minds Gregory Currie,Ian Ravenscroft,2002 Annotation Recreative Minds develops a philosophical theory of imagination that draws upon recent theories and results in psychology Ideas about how we read the minds of others have put the concept of imagination firmly back on the agenda for philosophy and psychology Currie and Ravenscroft present a theory of what they call imaginative projection they show how it fits into a philosophically motivated picture of the mind and of mental states and how it illuminates and is illuminated by recent developments in cognitive psychology They argue that we need to recognize a category of desire in imagination and that supposition and fantasy should be classed as forms of imagination They accommodate some of the peculiarities of perceptual forms of imagining such as visual and motor imagery and suggest that they are important for mind reading They argue for a novel view about the relations between imagination and pretence and suggest that imagining can be but need not be the cause of pretending They show how the theory accommodates but goes beyond the idea of mental simulation and argue that the contrast between simulation and theory is neither exclusive nor exhaustive They argue that we can understand certain developmental and psychiatric disorders as arising from faulty imagination Throughout they link their discussion to the uses of imagination in our encounters with art and they conclude with a chapter on responses to tragedy The final chapter also offers a theory of the emotions that suggests that these states have much in common with perceptual states Currie and Ravenscroft offer a lucid exploration of a

Mechanisms of Visual Coding Michael Jenkin,Laurence Harris,1997-05-13 All visual tasks from the simplest computer graphics program to the most complex biological visual system require an underlying representation of visual information The structure or coding of this representation provides the framework for processing the information Both the biological and computational communities have had to address the task of designing or inferring visual coding strategies This volume by some of the most active contributors in the field of visual coding describes some of the mechanisms used to code descriptions of visual phenomena in both areas These chapters illustrate the similarities in the problems considered and the common models and algorithms that are proposed to solve them The book includes an overview that sets the later chapters in context Researchers in neuroscience and computational vision will find a wealth of new ideas here Conceptual Representation

Helen Moss,James Hampton,James A. Hampton,2003 This special issue on conceptual representation contains invited papers from leading researchers across the range of cognitive science disciplines addressing the nature of semantic and conceptual representation in the mind and brain Choice ,1989 **Foundations of Geometric Cognition** Mateusz

Hohol,2019-09-12 The cognitive foundations of geometry have puzzled academics for a long time and even today are mostly unknown to many scholars including mathematical cognition researchers Foundations of Geometric Cognition shows that basic geometric skills are deeply hardwired in the visuospatial cognitive capacities of our brains namely spatial navigation

and object recognition These capacities shared with non human animals and appearing in early stages of the human ontogeny cannot however fully explain a uniquely human form of geometric cognition In the book Hohol argues that Euclidean geometry would not be possible without the human capacity to create and use abstract concepts demonstrating how language and diagrams provide cognitive scaffolding for abstract geometric thinking within a context of a Euclidean system of thought Taking an interdisciplinary approach and drawing on research from diverse fields including psychology cognitive science and mathematics this book is a must read for cognitive psychologists and cognitive scientists of mathematics alongside anyone interested in mathematical education or the philosophical and historical aspects of geometry
