Regularity Results For Nonlinear Elliptic Systems And Applications:

Regularity Results for Nonlinear Elliptic Systems and Applications Alain Bensoussan, Jens Frehse, 2013-04-17 The book collects many techniques that are helpful in obtaining regularity results for solutions of nonlinear systems of partial differential equations. They are then applied in various cases to provide useful examples and relevant results particularly in fields like fluid mechanics, solid mechanics, semiconductor theory or game theory. In general, these techniques are scattered in the journal literature and developed in the strict context of a given model. In the book, they are presented independently of specific models so that the main ideas are explained while remaining applicable to various situations. Such a presentation will facilitate application and implementation by researchers as well as teaching to students.

IUTAM Symposium on Theoretical, Computational and Modelling Aspects of Inelastic Media B. Daya Reddy, 2008-09-24 This work comprises papers based on some of the talks presented at the IUTAM Symposium of the same name held in Cape Town January 14-18, 2008. This volume treats cutting edge issues in modelling the behaviour of various classes of inelastic media and associated algorithms for carrying out computational simulations. A key feature of the contributions are works directed at modelling behaviour at the meso and micro scales and at bridging the micro-macro scales.

Nonlinear Partial Differential Equations with Applications Tomás Roubíček, 2006-01-17 This book primarily concerns quasilinear and semilinear elliptic and parabolic partial differential equations, inequalities, and systems. The exposition quickly leads from general theory to analysis of concrete equations which have specific applications in such areas as electrically semi-conductive media, modeling of biological systems, and mechanical engineering. Methods of Galerkin or of Rothe are exposed in a large generality.

Nonlinear Partial Differential Equations with Applications Tomáš Roubíček, 2013-01-13 This book primarily concerns quasilinear and semilinear elliptic and parabolic partial differential equations, inequalities, and systems. The exposition leads the reader through the general theory based on abstract pseudo-monotone or accretive operators as fast as possible towards the analysis of concrete differential equations which have specific applications in continuum thermo-mechanics of solids and fluids, electrically semi-conductive media, modelling of biological systems, or in mechanical engineering. Selected parts are mainly an introduction into the subject while some others form an advanced textbook. The second edition simplifies and extends the exposition at particular spots and augments the applications especially towards thermally coupled systems, magnetism, and more. The intended audience is graduate and PhD students as well as researchers in the theory of partial differential equations or in mathematical modelling of distributed parameter systems. The monograph contains a wealth of material in both the abstract theory of steady state or evolution

equations of monotone and accretive type and concrete applications to nonlinear partial differential equations from mathematical modeling The organization of the material is well done and the presentation although concise is clear elegant and rigorous this book is a notable addition to the existing literature Also it certainly will prove useful to engineers physicists biologists and other scientists interested in the analysis of nonlinear differential models of the real world Mathematical Reviews
