Regulation of Cellular Signal Transduction Pathways by Desensitization and Amplification David R. Sibley, Miles D. Houslay, 1994-03-29 Molecular Pharmacology of Cell Regulation Series Editor Miles D Houslay This important series provides topical in depth and authoritative reviews on all aspects of the molecular mechanisms of cell regulatory processes It attempts to unravel the molecular structures properties and functions of systems which provide putative targets for the next generation of drugs It will therefore be of major interest to biochemists pharmacologists molecular pathologists endocrinologists cell biologists and research clinicians working on the fundamental description of how cells regulate their own and each other's activity on the development of novel therapeutic agents and on analyses of pathological changes and genetic lesions Volume 3 Regulation of Cellular Signal Transduction Pathways by Desensitization and Amplification Edited by David R Sibley National Institutes of Health Bethesda Maryland USA and Miles D Houslay Institute of Biochemistry University of Glasgow UK Amplification and desensitization are well recognized phenomena in signal transduction systems and descriptions of such phenomena are essential in order to gain insight into the coordinated functioning of cells in normal pathological and transformed states Written by international experts this book will appeal to biochemists pharmacologists and other experimental biologists interested in cellular signalling systems

The Dopamine Receptors Kim Neve, Rachael L. Neve, 2013-03-09 Seven years after the cloning of the rat dopamine D receptor and four 2 years after the cloning of the last mammalian dopamine receptor identified to date this seems to be an excellent time to put together the present The Dopamine Receptors volume of this series The Receptors There has been time for considerable characterization of the novel receptor subtypes and new exciting lines of research from the molecular to the behavioral levels are taking shape We asked the contributors to The Dopamine Receptors to follow the superb example set by the previous volumes in this series by writing comprehensive historical reviews that will comprise an essential resource for specialists and newcomers to the dopamine receptor field while at the same time providing up to date summaries of the most active areas of research It is difficult these days to write about receptors without addressing the issue of receptor nomenclature For dopamine receptors valid arguments can be made for a system in which the subtypes are classified as belonging to the D1 or D2 classes with letters assigned in the order of cloning D A D D A 1 18 2 D Dc We decided however that common usage counts for something and 28 2 chose to use D D and D for the D2 like receptors because these names are 2 3 4 nearly unanimously used in the literature

Signal Transduction Mechanisms J.A. Barnes, H.G. Coore, Abdul H. Mohammed, Rajendra K. Sharma, 2013-03-09 This volume contains the proceedings of an International Symposium on Second Messenger Systems Molecular Cellular and Behavioural Aspects which was held at Tobago on June 16 17 1994 The interaction of an extracellular agonist First Messenger with its plasma membrane receptor leads to the transmission of a signal across the cell membrane and results in the production and or activation of other signalling molecules Second Messengers These Second Messengers

control the action of many protein kinases and protein phosphatases and so lead to cellular responses Although the biochemical basis of the transduction of signals in the main signalling systems in eukaryotic cells is probably largely known intensified research is ongoing in the following areas the discovery of specific substrates for many protein kinases elucidation of the biological significance of the differential tissue expression and heterogeneity of many signalling proteins and the unravelling of diverse interactions such as signal potentiation synergism antagonism and neuronal co transmission between signalling systems As knowledge from such studies accumulates it is becoming clear that the cross talk interactions between signalling systems are important features of dynamic cell regulation This volume is designed to summarize some aspects of the current work on various Second Messenger Systems and the integration of signals with respect to plasma membrane receptors Second Messenger generation and degradation protein kinase and phosphatase cell cycle control and cellular learning and memory

Brann, 2012-12-06 LESLIE L IVERSEN The present series of volumes is well timed as the impact of molecular genetics on pharmacology has been profound and a comprehensive review of the rapid advances of the past decade is much needed Since the pioneering work of Dale Ariens and others in the early years of this century much of pharmacology has been founded on the concept of receptors To begin with the receptor was conceived of as a black box which recognized and transduced the biological effects of neurotransmitters hormones or other biological messengers and which could also represent a target for man made drugs It is only in the last two decades that molecular pharmacology has blossomed first with the advent of radioligand binding techniques and second messenger studies which greatly facilitated the biochemical study of drug receptor interactions and latterly with increasing knowledge of the molecular architecture of the receptor proteins themselves This started with the traditional biochemical approach of isolating and purifying the receptor molecules This proved to be a task of immense technical difficulty because of the low density of receptors in most biological source tissues although there were some notable successes e g the purification of the nicotinic acetylcholine receptor from the electric organ of Torpedo It was the application of molecular genetics technology during the 1980s however which really accelerated progress in this field **Advances in Research on Neurodegeneration** Y. Mizuno, M.B.H. Youdim, D.B. Calne, R. Horowski, W. Poewe, P. Riederer, 2013-03-07 Neurodegeneration is one of the most important subjects of the investigation now and in the coming 21st century Alzheimer's disease is the leading cause of dementia in the elderly people and Parkinson's disease is one of the major neurologic disorders with the prevalence between 1 and 2 1 000 population in advanced countries Many others are suffering from intractable neurodegenerative disorders such as amyotrophic lateral sclerosis Huntington's disease or spinocerebellar degeneration No truly effective treatment is available for any of these neurodegenerative disorders except for Parkinson's disease even in Parkinson's disease still it is impossible to slow down the disease process with the currently available treatment It is urgently needed to develop new effective technique to halt or slow down the disease process in each of those disorders Recent advance in the molecular biological and molecular genetic technique has brought us great progress in the understanding of etiology and pathogenesis of these disorders but still it is not known how neurons are going to die in these disorders To explore the question mutual cooperation and exchange of ideas between basic scientists and clinical peoples are of utmost importance **Berne and Levy Physiology E-Book** Bruce M.
