

A Systems Analysis of the Decision-Making Process: Psychiatry's "Basic Science"

CHARLES E. GOSHEN, M.D.* | Morgantown, W. Va.

Meaning of Systems Analysis

A "system" is a sequence of time-varying quantities, each one functionally related to the others. "Systems Analysis" is the scientific study of complex systems, the end-product of which is a "flow diagram" which shows the inter-relationships of the components of the system, as well as "inputs" coming from outside the system, and the "outputs" leaving the system. A related field is "Operations Research," which is the study of complex systems having the objective of providing "cost-effectiveness" information needed to make executive decisions (the product, therefore, being the "optimum" decision). Essential to the understanding of a complex system is the realization that the output of one component becomes the input to the next (later in the sequence) component or components, making each pair in the sequence a simple system with the entire complex system then composed of a set of simple ones. What "flows" from one component to the next is either (1) a signal, that is, information, or (2) power, that is, the energy needed to activate the system.

A signal might have any of the following qualities: (1) it might be useful information which instructs the next component what to do, (2) it might be information used to monitor the system for purpose of control, in which case it is known as "feedback," or (3) it might be an unwanted or useless signal, in which case it is known as "noise."

In "Operations Research" a hypothetical (usually mathematical) model† of the system is designed which is then used to simulate the actual system. This device lends itself to computerization,† making it possible to test out the model by computer simulation.† The design of the model requires a knowledge of all the variables in the system in order to calculate the way and the degree to which each influences the system. The result obtained from solving the equations of the model usually gives a range of the possible "costs"† against a corresponding range of the possible levels of "effectiveness"† for all possible executive decisions, from which can then be chosen the "opti-
