Abstract. Privacy concerns have gotten more attention as Big Data has spread. The difficulties of striking a balance between the value of data and individual privacy have led to the emergence of privacy-preserving data mining and analytics approaches as a crucial area of research. An overview of the major ideas, methods, and developments in privacy-preserving data mining and analytics in the context of Big Data is given in this abstract. Data mining that protects privacy tries to glean useful insights from huge databases while shielding the private data of individuals. Commonly used in traditional data mining methods, sharing or pooling data might have serious privacy implications. On the other hand, privacy-preserving data mining strategies concentrate on creating procedures and algorithms that enable analysis without jeopardizing personal information. Finally, privacy-preserving data mining and analytics in the Big Data age bring important difficulties and opportunities. An overview of the main ideas, methods, and developments in privacy-preserving data mining and analytics are given in this abstract. It underscores the value of privacy in the era of data-driven decision-making and the requirement for effective privacy-preserving solutions to safeguard sensitive personal data while facilitating insightful analysis of huge datasets.

INTRODUCTION

This abstract examines numerous data mining and analytics methods that protect user privacy, such as homomorphic encryption, safe multiparty computing, and differential privacy. By incorporating controlled noise into the analytic process, differential privacy offers a rigorous mathematical foundation to secure privacy and prevents the identification of specific persons. Multiple parties can work together on data analysis using secure multiparty computing without disclosing their individual inputs. By enabling calculations to be done directly on encrypted data, homomorphic encryption protects privacy while

Privacy Preserving Data Mining:

Privacy Preserving Data Mining Jaideep Vaidya, Christopher W. Clifton, Yu Michael Zhu, 2006-09-28 Data mining has emerged as a significant technology for gaining knowledge from vast quantities of data. However, concerns are growing that use of this technology can violate individual privacy. These concerns have led to a backlash against the technology, for example a Data Mining Moratorium Act introduced in the U.S. Senate that would have banned all data mining programs including research and development by the U.S. Department of Defense. *Privacy Preserving Data Mining* provides a comprehensive overview of available approaches, techniques, and open problems in privacy preserving data mining. This book demonstrates how these approaches can achieve data mining while operating within legal and commercial restrictions that forbid release of data. Furthermore, this research crystallizes much of the underlying foundation and inspires further research in the area. *Privacy Preserving Data Mining* is designed for a professional audience composed of practitioners and researchers in industry. This volume is also suitable for graduate level students in computer science. *Privacy-Preserving Data Mining* Charu C. Aggarwal, Philip S. Yu, 2008-06-10 Advances in hardware technology have increased the capability to store and record personal data about consumers and individuals, causing concerns that personal data may be used for a variety of intrusive or malicious purposes. *Privacy Preserving Data Mining: Models and Algorithms* proposes a number of techniques to perform the data mining tasks in a privacy preserving way. These techniques generally fall into the following categories: data modification techniques, cryptographic methods and protocols for data sharing, statistical techniques for disclosure and inference control, query auditing methods, randomization and perturbation based techniques. This edited volume contains surveys by distinguished researchers in the privacy field. Each survey includes the key research content as well as future research directions. *Privacy Preserving Data Mining: Models and Algorithms* is designed for researchers, professors, and advanced level students in computer science and is also suitable for industry practitioners. *Data Transformation for Privacy-preserving Data Mining* Stanley Robson de Medeiros Oliveira, 2005 The sharing of data is often beneficial in data mining applications. It has been proven useful to support both decision making processes and to promote social goals. However, the sharing of data has also raised a number of ethical issues. Some such issues include those of privacy, data security, and intellectual property rights. In this thesis, we focus primarily on privacy issues in data mining, notably when data are shared before mining. Specifically, we consider some scenarios in which applications of association rule mining and data clustering require privacy safeguards. Addressing privacy preservation in such scenarios is complex. One must not only meet privacy requirements but also guarantee valid data mining results. This status indicates the pressing need for rethinking mechanisms to enforce privacy safeguards without losing the benefit of mining. These mechanisms can lead to new privacy control methods to convert a database into a new one in such a way as to preserve the main features of the original database for mining. In particular, we address the problem of transforming a database to be shared into a new one that

conceals private information while preserving the general patterns and trends from the original database To address this challenging problem we propose a unified framework for privacy preserving data mining that ensures that the mining process will not violate privacy up to a certain degree of security The framework encompasses a family of privacy preserving data transformation methods a library of algorithms retrieval facilities to speed up the transformation process and a set of metrics to evaluate the effectiveness of the proposed algorithms in terms of information loss and to quantify how much private information has been disclosed Our investigation concludes that privacy preserving data mining is to some extent possible We demonstrate empirically and theoretically the practicality and feasibility of achieving privacy preservation in data mining Our experiments reveal that our framework is effective meets privacy requirements and guarantees valid data mining results while protecting sensitive information e.g sensitive knowledge and individuals privacy
