Audio ,1983 Construction and Building Automation Benny Raphael,2022-07-26 This book is intended to be used as a textbook in undergraduate civil engineering and construction courses to introduce cutting edge mechanical electrical and computer science topics that are needed for civil and construction engineers to collaborate in inter disciplinary automation projects Part I introduces the basics of hardware and software technologies that are needed for implementing automation in buildings and construction The content begins with the fundamental concepts and uses practical examples to bring out the benefits of automation through case studies that are easy to understand No other book uniformly treats the subject of

automation within the context of buildings and construction activities While the technology needed for these two application domains are similar the unifying principles are not well recognized This book will bring out the fundamental principles that could form the basis of application to these two domains For example it will become clear that sensors actuators and controllers along with smart control strategies could be used for automating tasks within buildings and on construction sites Part II of the book will introduce key advances in the areas of machine learning and artificial intelligence that are significant for the intelligent control of buildings and construction equipment Control algorithms and techniques for data analytics are explained in a form that is appropriate for non computer science students Each chapter contains several hands on exercises meant to apply the principles that are covered These include numerical problems as well as design and analysis examples This new textbook Introduces hardware and software needed for automating engineering tasks Presents examples of applications in the control of building systems Illustrates of the use of automation for improving construction processes Provides a lucid introduction to advanced computing concepts machine learning artificial intelligence and control algorithms to construction and engineering students It is sure to be essential reading for a growing number of courses in smart construction building automation robotics intelligent buildings and construction 4 0 Supplementary material including answers to exercises in the book will be provided on the author s website <https://bennyraphael.com/book2022> Robotic Vision Peter Corke, 2021-10-15 This textbook offers a tutorial introduction to robotics and Computer Vision which is light and easy to absorb The practice of robotic vision involves the application of computational algorithms to data Over the fairly recent history of the fields of robotics and computer vision a very large body of algorithms has been developed However this body of knowledge is something of a barrier for anybody entering the field or even looking to see if they want to enter the field What is the right algorithm for a particular problem and importantly How can I try it out without spending days coding and debugging it from the original research papers The author has maintained two open source MATLAB Toolboxes for more than 10 years one for robotics and one for vision The key strength of the Toolboxes provide a set of tools that allow the user to work with real problems not trivial examples For the student the book makes the algorithms accessible the Toolbox code can be read to gain understanding and the examples illustrate how it can be used instant gratification in just a couple of lines of MATLAB code The code can also be the starting point for new work for researchers or students by writing programs based on Toolbox functions or modifying the Toolbox code itself The purpose of this book is to expand on the tutorial material provided with the toolboxes add many more examples and to weave this into a narrative that covers robotics and computer vision separately and together The author shows how complex problems can be decomposed and solved using just a few simple lines of code and hopefully to inspire up and coming researchers The topics covered are guided by the real problems observed over many years as a practitioner of both robotics and computer vision It is written in a light but informative style it is easy to read and absorb and includes a lot of Matlab examples and figures The book is a real walk through the
