Robust Discrete Optimization And Its Applications:

Robust Discrete Optimization and Its Applications Panos Kouvelis, Gang Yu, 2013-03-09 This book deals with decision making in environments of significant data uncertainty with particular emphasis on operations and production management applications. For such environments we suggest the use of the robustness approach to decision making which assumes inadequate knowledge of the decision maker about the random state of nature and develops a decision that hedges against the worst contingency that may arise. The main motivating factors for a decision maker to use the robustness approach are that it does not ignore uncertainty and takes a proactive step in response to the fact that forecasted values of uncertain parameters will not occur in most environments. It applies to decisions of unique non-repetitive nature which are common in many fast and dynamically changing environments. It accounts for the risk-averse nature of decision makers and it recognizes that even though decision environments are fraught with data uncertainties, decisions are evaluated ex post with the realized data. For all of the above reasons, robust decisions are dear to the heart of operational decision makers. This book takes a giant first step in presenting decision support tools and solution methods for generating robust decisions in a variety of interesting application environments. Robust Discrete Optimization is a comprehensive mathematical programming framework for robust decision making.

Vector Variational Inequalities and Vector Equilibria F. Giannessi, 2013-12-01 The book deals with the mathematical theory of vector variational inequalities with special reference to equilibrium problems. Such models have been introduced recently to study new problems from mechanics, structural engineering, networks, and industrial management and to revisit old ones. The common feature of these problems is that given by the presence of concurrent objectives and by the difficulty of identifying a global functional like energy to be extremized. The vector variational inequalities have the advantage of both the variational ones and vector optimization which are found as special cases. Among several applications, the equilibrium flows on a network receive special attention. Audience: The book is addressed to academic researchers as well as industrial ones in the fields of mathematics, engineering, mathematical programming, control theory, operations research, computer science, and economics.

Foundations of Bilevel Programming Stephan Dempe, 2005-12-19 Bilevel programming problems are hierarchical optimization problems where the constraints of one problem, the so-called upper level problem, are defined in part by a second parametric optimization problem, the lower level problem. If the lower level problem has a unique optimal solution for all parameter values, this problem is equivalent to a one-level optimization problem having an implicitly defined objective function. Special emphasis in the book is on problems having non-unique lower level optimal solutions; the optimistic or weak and the pessimistic or strong approaches are discussed. The book starts with the required results in parametric nonlinear optimization. This is followed by the main theoretical results, including necessary and sufficient optimality conditions and solution algorithms for bilevel problems. Stationarity conditions can be applied to the lower level problem to transform the optimistic bilevel programming problem into a one-level problem. Properties of the

resulting problem are highlighted and its relation to the bilevel problem is investigated Stability properties numerical complexity and problems having additional integrality conditions on the variables are also discussed Audience Applied mathematicians and economists working in optimization operations research and economic modelling Students interested in optimization will also find this book useful

Algorithm Engineering Lasse Kliemann, Peter Sanders, 2016-11-10 Algorithm Engineering is a methodology for algorithmic research that combines theory with implementation and experimentation in order to obtain better algorithms with high practical impact Traditionally the study of algorithms was dominated by mathematical worst case analysis In Algorithm Engineering algorithms are also implemented and experiments conducted in a systematic way sometimes resembling the experimentation processes known from fields such as biology chemistry or physics This helps in counteracting an otherwise growing gap between theory and practice

Multicriteria analysis is a rapidly growing aspect of operations research and management science with numerous practical applications in a wide range of fields This book presents all the recent advances in multicriteria analysis including multicriteria optimization goal programming outranking methods and disaggregation techniques The latest developments on robustness analysis preference elicitation and decision making when faced with incomplete information are also discussed together with applications in business performance evaluation finance and marketing Finally the interactions of multicriteria analysis with other disciplines are also explored including among others data mining artificial intelligence and evolutionary methods Multiobjective Optimization Jürgen Branke,2008-10-15 Multiobjective optimization deals with solving problems having not only one but multiple often conflicting criteria Such problems can arise in practically every field of science engineering and business and the need for efficient and reliable solution methods is increasing The task is challenging due to the fact that instead of a single optimal solution multiobjective optimization results in a number of solutions with different trade offs among criteria also known as Pareto optimal or efficient solutions Hence a decision maker is needed to provide additional preference information and to identify the most satisfactory solution Depending on the paradigm used such information may be introduced before during or after the optimization process Clearly research and application in multiobjective optimization involve expertise in optimization as well as in decision support This state of the art survey originates from the International Seminar on Practical Approaches to Multiobjective Optimization held in Dagstuhl Castle Germany in December 2006 which brought together leading experts from various contemporary multiobjective optimization

fields including evolutionary multiobjective optimization EMO multiple criteria decision making MCDM and multiple criteria decision aiding MCDA This book gives a unique and detailed account of the current status of research and applications in the field of multiobjective optimization It contains 16 chapters grouped in the following 5 thematic sections Basics on Multiobjective Optimization Recent Interactive and Preference Based Approaches Visualization of Solutions Modelling Implementation and Applications and Quality Assessment Learning and Future Challenges Quasidifferentiability and Related Topics Vladimir F. nonconvex including global optimization The papers are organised in two sections Since we are at the beginning of a new millennium the first paper starts by looking back at the beginnings of optimum experimental design in 1917 and sketches the development up to Kiefer's paper read to the Royal Statistical Society in 1959 This is the first in a group of papers which we have labelled Theory which cover the more general aspects such as the properties and methods of construction of designs In the Applications section there are papers on sequential design problems arising in the pharmaceutical industry and on the designs with discrete factors which occur in agriculture There are also papers on training neural networks on the efficient design of sampling methods on design problems in mixtures arising from a study of glass manufacturing and on the resistance of Brazilian weeds to herbicides The number attending the meeting was deliberately limited to 50 in order to encourage a workshop atmosphere and the exchange of ideas

Generalized Convexity, Generalized Monotonicity:

Recent Results Jean-Pierre Crouzeix, Juan Enrique Martinez Legaz, Michel Volle, 2013-12-01 A function is convex if its epigraph is convex This geometrical structure has very strong implications in terms of continuity and differentiability Separation theorems lead to optimality conditions and duality for convex problems A function is quasiconvex if its lower level sets are convex Here again the geometrical structure of the level sets implies some continuity and differentiability properties for quasiconvex functions Optimality conditions and duality can be derived for optimization problems involving such functions as well Over a period of about fifty years quasiconvex and other generalized convex functions have been considered in a variety of fields including economics management science engineering probability and applied sciences in accordance with the need of particular applications During the last twenty five years an increase of research activities in this field has been witnessed More recently generalized monotonicity of maps has been studied It relates to generalized convexity off functions as monotonicity relates to convexity Generalized monotonicity plays a role in variational inequality problems complementarity problems and more generally in equilibrium problems

classes of boundary value problems Our framework includes multivalued elliptic problems with discontinuities variational inequalities hemivariational inequalities and evolution problems The treatment relies on variational methods monotonicity principles topological arguments and optimization techniques Excepting Sections 1 and 3 in Chapter 1 and Sections 1 and 3 in Chapter 2 the material is new in comparison with any other book representing research topics where the authors contributed The outline of our work is the following

Semi-Infinite Programming Rembert Reemtsen, Jan-J. Rückmann, 2013-03-14 Semi infinite programming briefly SIP is an exciting part of mathematical programming SIP problems include finitely many variables and in contrast to finite optimization problems infinitely many inequality constraints Problems of this type naturally arise in approximation theory optimal control and at numerous engineering applications where the model contains at least one inequality constraint for each value of a parameter and the parameter representing time space frequency etc varies in a given domain The treatment of such problems requires particular theoretical and numerical techniques The theory in SIP as well as the number of numerical SIP methods and applications have expanded very fast during the last years Therefore the main goal of this monograph is to provide a collection of tutorial and survey type articles which represent a substantial part of the contemporary body of knowledge in SIP We are glad that leading researchers have contributed to this volume and that their articles are covering a wide range of important topics in this subject It is our hope that both experienced students and scientists will be well advised to consult this volume We got the idea for this volume when we were organizing the semi infinite programming workshop which was held in Cottbus Germany in September 1996

From Convexity to Nonconvexity R.P. Gilbert, Panagiotis D. Panagiotopoulos, Panos M. Pardalos, 2013-12-01 This collection of papers is dedicated to the memory of Gaetano Fichera a great mathematician and also a good friend to the editors Regrettably it took an unusual amount of time to bring this collection out This was primarily due to the fact that the main editor who had collected all of the materials for this volume P D Panagiotopoulos died unexpectedly during the period when we were editing the manuscript The other two editors in appreciation of Panagiotopoulos contribution to this field believe it is therefore fitting that this collection be dedicated to his memory also The theme of the collection is centered around the seminal research of G Fichera on the Signorini problem Variants on this idea enter in different ways For example by bringing in friction the problem is no longer self adjoint and the minimization formulation is not valid A large portion of this collection is devoted to survey papers concerning hemivariational methods with a main point of its application to nonsmooth mechanics Hemivariational inequalities which are a generalization of variational inequalities were pioneered by Panagiotopoulos There are many applications of this theory to the study of non convex energy functionals occurring in many branches of mechanics An area of concentration concerns contact problems in particular quasistatic and dynamic contact problems with friction and damage Nonsmooth optimization methods which may be divided into the main groups of subgradient methods and bundle methods are also discussed in this collection
