is concerned with the smart enhancement of earthquake resilience of building structures under both near fault and long duration ground motions A hybrid system of base isolation and building connection control was proposed and its earthquake resilience to near fault and long duration ground motions was evaluated by a double impulse and a multiple impulse It was demonstrated that the base isolation is effective for near fault ground motions and the building connection system using passive dampers is effective for long duration ground motions The third article is related to the robustness evaluation of elastic plastic base isolated high rise buildings under resonant near fault ground motions The robustness function was introduced to evaluate quantitatively the robustness of elastic plastic base isolated high rise buildings The fourth article is an extension of the previously proposed energy balance approach to a bilinear elastic plastic single degree of freedom system under a long duration sinusoidal ground motion A historical difficulty in nonlinear vibration posed by Caughey 1960 and Iwan 1961 has been overcome in a smart manner after half a century The approach presented in this eBook together with the previous eBooks is an epoch making accomplishment to open the door for simpler and deeper understanding of structural reliability and resilience of built environments in the elastic plastic and nonlinear range *Judge Dredd in Oz* John
