**A Course in Modern Geometries** Judith N. Cederberg, 2013-03-09 A Course in Modern Geometries is designed for a junior senior level course for mathematics majors including those who plan to teach in secondary school Chapter 1 presents several finite geometries in an axiomatic framework Chapter 2 introduces Euclid's geometry and the basic ideas of non Euclidean geometry The synthetic approach of Chapters 1 2 is followed by the analytic treatment of transformations of the Euclidean plane in Chapter 3 Chapter 4 presents plane projective geometry both synthetically and analytically The extensive use of matrix representations of groups of transformations in Chapters 3 4 reinforces ideas from linear algebra and serves as excellent preparation for a course in abstract algebra Each chapter includes a list of suggested sources for applications and or related topics

**A Course in Modern Geometries** Judith Cederberg, 2004-09-23 Designed for a junior senior level course for mathematics majors including those who plan to teach in secondary school The first chapter presents several finite geometries in an axiomatic framework while Chapter 2 continues the synthetic approach in introducing both Euclid's and ideas of non Euclidean geometry There follows a new introduction to symmetry and hands on explorations of isometries that precedes an extensive analytic treatment of similarities and affinities Chapter 4 presents plane projective geometry both synthetically and analytically and the new Chapter 5 uses a descriptive and exploratory approach to introduce chaos theory and fractal geometry stressing the self similarity of fractals and their generation by transformations from Chapter 3 Throughout each chapter includes a list of suggested resources for applications or related topics in areas such as art and history plus this second edition points to Web locations of author developed guides for dynamic software explorations of the Poincaré model isometries projectivities conics and fractals Parallel versions are available for Cabri Geometry and Geometers Sketchpad

Chavez,2019-10-02 Many features of this book are designed to emphasize the proper way to write reliable MATLAB programs These features should serve a student well when he or she is first learning MATLAB and they should also be useful to the practitioner on the job They include 1 Emphasis on Top Down Design Methodology The book introduces a top down design methodology in Chapter 3 and uses it consistently throughout the rest of the book This methodology encourages a student to think about the proper design of a program before beginning to code It emphasizes the importance of clearly defining the problem to be solved and the required inputs and outputs before any other work is begun Once the problem has been properly defined it teaches the student to employ stepwise refinement to break the task down into successively smaller sub tasks and to implement the subtasks as separate subroutines or functions Finally it teaches the importance of testing at all stages of the process both unit testing of the component routines and exhaustive testing of the final product The formal design process taught by the book may be summarized as follows i Clearly state the problem that you are trying to solve ii Define the inputs required by the program and the outputs to be produced by the program iii Describe the algorithm that you intend to implement in the program This step involves top down design and stepwise decomposition using pseudocode or flow charts iv Turn the algorithm into MATLAB statements v Test the MATLAB program This step includes unit testing of specific functions as well as exhaustive testing of the final program with many different data sets 2 Emphasis on Functions The book emphasizes the use of functions to logically decompose tasks into smaller sub tasks It teaches the advantages of functions for data hiding It also emphasizes the importance of unit testing functions before they are combined into the final program In addition the book teaches about the common mistakes made with functions and how to avoid them 3 Emphasis on MATLAB Tools The book teaches the proper use of MATLAB s built in tools to make programming and debugging easier The tools covered include the Editor Debugger the Workspace Browser the Help Browser and GUI design tools      **Applying**

**The Geometry of Genocide** Bradley Campbell, 2015-10-29 In *The Geometry of Genocide* Bradley Campbell argues that genocide is best understood not as deviant behavior but as social control a response to perceived deviant behavior on the part of victims Using Donald Black's method of pure sociology Campbell considers genocide in relation to three features of social life diversity inequality and intimacy According to this theory genocidal conflicts begin with changes in diversity and inequality such as when two previously separated ethnic groups come into contact or when a subordinate ethnic group attempts to rise in status Further conflicts are more likely to result in genocide when they occur in a context of social distance and inequality and when aggressors and victims cannot be easily separated Campbell applies his approach to five cases the killings of American Indians in 1850s California Muslims in 2002 India and 1992 Bosnia Tutsis in 1994 Rwanda and Jews in 1940s Europe These case studies which focus in detail on particular incidents within each instance of genocide demonstrate the theory's ability to explain an array of factors including why genocide occurs and who participates Campbell's theory uniquely connects the study of genocide to the larger study of conflict and social control By situating genocide among these broader phenomena *The Geometry of Genocide* provides a novel and compelling explanation of genocide while furthering our understanding of why humans have conflicts and why they respond to conflict as they do

**Conics and Cubics** Robert Bix, 2013-03-14 Algebraic curves are the graphs of polynomial equations in two variables such as  $y^3 = 5xy^2 + x^2xy$  By focusing on curves of degree at most 3 lines conics and cubics this book aims to fill the gap between the familiar subject of analytic geometry and the general study of algebraic curves This text is designed for a one semester class that serves both as a geometry course for mathematics majors in general and as a sequel to college geometry for teachers of secondary school mathematics The only prerequisite is first year calculus On the one hand this book can serve as a text for an undergraduate geometry course for all mathematics majors Algebraic geometry unites algebra geometry topology and analysis and it is one of the most exciting areas of modern mathematics Unfortunately the subject is not easily accessible and most introductory courses require a prohibitive amount of mathematical machinery We avoid this problem by focusing on curves of degree at most 3 This keeps the results tangible and the proofs natural It lets us
