## What Are Rocks?

Rocks are solid materials formed from crystals of one or more minerals. The Earth's crust is made up of many different types of rock.

## What Are Different Types of Rock?

There are three main types of rock: igneous, sedimentary, and metamorphic. Each type is formed in a different way.

### Sedimentary

Sedimentary rocks are formed when other rocks are broken down by wind and water. These rocks are then carried by rivers and oceans to the bottom of seas or oceans. Over millions of years, the sediment is buried and compressed. Over time, the pressure causes the sediment to turn into rock. These sedimentary rocks are formed from the remains of dead animals or plants.

These rocks contain fossils of plants and animals that lived millions of years ago.

These rocks are made of small pieces of sand, silt, and clay that have been pressed together.

These rocks are formed from molten material that has cooled and solidified. They can be formed from magma or lava that has cooled on the Earth's surface, or from molten material that has cooled underground.

## Types of Rocks?

There are three main types of rock: igneous, sedimentary, and metamorphic.

### Permeable or Impermeable?

Can water pass through it?

If a rock is permeable, water can pass through it. If it is impermeable, water cannot pass through it.

### Shape or Size?

Does it have a regular shape?

Some rocks have a regular shape, while others do not. This can help geologists identify different types of rocks.

## What Are Fossils?

Fossils are the preserved remains of plants and animals that lived millions of years ago. They can be found in sedimentary rocks. Fossils are formed when the remains of an organism are buried in sediment and then preserved over time.

## How Are Fossils Formed?

Fossils are formed through a process called fossilization. When a living thing dies, its remains are buried in sediment. Over time, the sediment hardens, trapping the remains of the organism. This process can take millions of years to complete.
