

Rocks

What Are Rocks?

Rocks are solid materials formed from crystals of one or more minerals. The Earth's crust is made up of many different types of rock.

What Are Different Types of Rock?

There are three main types of rock: igneous, sedimentary, and metamorphic. Each type is formed in a different way.

Sedimentary

Sedimentary rocks are formed when other rocks are broken down by wind and water. These rocks are then carried by rivers and oceans to the bottom of seas or oceans. Over millions of years, the sediment is buried and compressed. Over time, the pressure causes the sediment to turn into rock. These sedimentary rocks are formed from the remains of dead animals or plants.

These rocks contain fossils of plants and animals. They are often found in layers and can be used to tell the age of the rock.

Metamorphic rocks are formed from igneous and sedimentary rocks. They are changed by heat and pressure into new types of rock. These rocks are often found in the same areas as igneous and sedimentary rocks.

What Are Igneous?

Igneous are the primary means of earth and minerals that have solidified from a molten state. They are made of minerals and are found in the same areas as sedimentary and metamorphic rocks.

How Are Igneous Formed?

Igneous are formed through a process called crystallization. When a liquid (magma) cools, the atoms or ions that make up the liquid arrange themselves into a regular pattern. This process is called crystallization. The crystals that form are called igneous rocks.
