Role Of Protein And Amino Acids In Sustaining And Enhancing Performance:

The Role of Protein and Amino Acids in Sustaining and Enhancing Performance Institute of Medicine, Committee on Military Nutrition Research, 1999-09-15 It is a commonly held belief that athletes particularly body builders have greater requirements for dietary protein than sedentary individuals However the evidence in support of this contention is controversial This book is the latest in a series of publications designed to inform both civilian and military scientists and personnel about issues related to nutrition and military service Among the many other stressors they experience soldiers face unique nutritional demands during combat Of particular concern is the role that dietary protein might play in controlling muscle mass and strength response to injury and infection and cognitive performance The first part of the book contains the committee's summary of the workshop responses to the Army's questions conclusions and recommendations The remainder of the book contains papers contributed by speakers at the workshop on such topics as the effects of aging and hormones on regulation of muscle mass and function alterations in protein metabolism due to the stress of injury or infection the role of individual amino acids the components of proteins as neurotransmitters hormones and modulators of various physiological processes and the efficacy and safety considerations associated with dietary supplements aimed at enhancing performance

Nutrient Composition of Rations for Short-Term, High-Intensity Combat Operations Institute of Medicine, Food and Nutrition Board, Committee on Military Nutrition Research, Committee on Optimization of Nutrient Composition of Military Rations for Short-Term, High-Stress Situations, 2006-01-09 Recognizing the importance of good nutrition for physical and mental status the Department of Defense asked the Institute of Medicine to guide the design of the nutritional composition of a ration for soldiers on short term high stress missions Nutrient Composition of Rations for Short Term High Intensity Combat Operations considers military performance health concerns food intake energy expenditure physical exercise and food technology issues The success of military operations depends to a large extent on the physical and mental status of the individuals involved Appropriate nutrition during assault missions is a continuous challenge mainly due to diminished appetites of individuals under stress Many less controllable and unpredictable factors such as individual preferences and climate come into play to reduce appetite In fact soldiers usually consume about half of the calories needed leaving them in a state called negative energy balance The consequences of being in negative energy balance while under these circumstances range from weight loss to fatigue to mental impairments An individual's physiological and nutritional status can markedly

affect one's ability to maximize performance during missions and may compromise effectiveness. With the number of these missions increasing, the optimization of rations has become a high priority.

Military Quantitative Physiology Karl Friedl, William R. Santee, Borden Institute (U.S.), 2012. NOTE: NO FURTHER DISCOUNT FOR THIS PRINT PRODUCT. OVERSTOCK SALE. Significantly reduced list price. Few human activities demand or deserve as much attention of the citizens of a nation as the array of man-made and natural environmental threats faced by the soldiers and other warriors defending the nation: those that pose the risk of disease, injury, combat wounds, and even death. This book is the Army's first detailing research in computational physiology models and highlighting pivotal research. It outlines the extent to which basic and applied biomedical scientists, clinicians, modelers, and others strive to understand the extent of these threats and provide intellectual and materiel options to mitigate these risks. This book summarizes major Army research efforts to quantify and model military-relevant physiology. These chapters highlight the translation of this research into useful predictive tools. The tools are of importance to medical planners, materiel developers, commanders, and in many cases, every soldier. These chapters detail the experimental basis for many of the predictive tools that are currently in use. This book is written for military clinicians and medical researchers who may be reasonably expected to explain some of the background as well as those who will extend the research. Many people will find this book interesting because it details research on topics that affect everyone in everyday life, including how we sleep, eat, and exercise, as well as more specific topics such as the effects of caffeine on performance, risks associated with laser pointers, and even Army blast models that have influenced safety thresholds for car airbag deployments.
