Metallothioneins and Related Chelators Astrid Sigel, Helmut Sigel, Roland K. O. Sigel, 2009
Chapters 3 to 5 give an account of bacterial MTs MTs in yeast and fungi and MTs in plants Most astonishingly the MTs of bacteria and plants contain next to cysteine also histidine residues and thus metal ions are not only sulfur but also imidazole coordinated which gives rise to zinc finger like structures Remarkably yeast and fungal MTs are Cu I rather than Zn II or Cd II binding proteins Next Chapters 6 through 9 discuss the MTs of dipteran insects including the model organism *Drosophila melanogaster* earthworms and nematodes as well as echinoderms crustaceans molluscs and fish Actually aquatic animals both vertebrates and invertebrates have the potential to be used for monitoring metal contamination in aquatic ecosystems Interestingly in Chapter 9 the remarkable speculation is presented that under chronic natural exposure conditions the animals establish a trade off between the cost of detoxifying non essential metals and the cost of allowing some of these metals to spill over onto metal sensitive sites This contrasts with laboratory experiments involving aquatic animals where the toxicity of non essential metals normally exhibits a threshold response at low exposure concentrations the organisms can detoxify the incoming metal and thus tolerate the exposure whereas at concentrations above the threshold the detoxification mechanism is no longer able to protect the organism completely
