

Psychobiology of language. Michael Studdert-Kennedy (Ed.). Cambridge, Ma.: MIT Press, 1983. pp. xiv + 258.

To what extent can language be viewed as an autonomous cognitive system? This is the question that was addressed by the linguists, psychologists, and neuroscientists who participated in the Neurosciences Research Program Work Session from which this volume evolved. The chapters of this book are, for the most part, revised and/or extended versions of the oral presentations made by the participants in the Work Session. The comments that follow some chapters and constitute the final section of the book are the editor's summaries and interpretations of the participants' discussions of the talks.

The autonomy question bears directly on whether one can, in fact, study the psychobiology of language. As Studdert-Kennedy points out in his introductory chapter, if language is not in some sense a separate system, there can be no biology of language. Nevertheless, language behavior cannot be entirely independent. The interdependence of language and perceptuomotor processes, for example, is a recurring theme in this volume. The effort to isolate language biologically from other cognitive functions is not successful; rather, the contributors to this volume approach this goal by attempting to define the basic units of language in linguistic, psychological, and neuropsychological terms. Each of these three approaches to the search for primitives is presented in the chapters in the first of the six parts of the book, the introductory section. Representing the linguistic view, Liberman defines autonomy in terms of a formal separateness of the basic elements, and of the kinds of relations among those elements, appropriate for describing a set of phenomena. Thus, language is viewed as consisting of three autonomous subsystems: phonology, semantics, and syntax. Psychologists and neuroscientists apply their own principles to the phenomena of interest to their fields in order to determine whether these three language subsystems are also autonomous in nonlinguistic terms. Pylyshyn applies the criterion of cognitive impenetrability, or immunity to the effects of changes in collateral information, to the question of the autonomy of language. In psychological terms, he claims, language is autonomous in the sense that there is an important part of language that is cognitively impenetrable and specific to language. Goodglass investigates neurological independence in terms of the extent to which a subsystem may be selectively impaired or activated. Although dissociations between input and output impairments are observed, these do not undermine the notion of central, autonomous processing systems for syntax, phonology, and lexical semantics, because the input/output dissociations may be explained in terms of low-level acoustic and motor processes.

The three sections which comprise the main body of the text address specific aspects of language — perceptuomotor processes, lexical processes, and syntactic processes — in a variety of ways. For example, the section on perceptuomotor processes consists of four chapters which present strikingly different approaches to this topic. Studdert-Kennedy's chapter suggests that speech perception may be directly linked to the motor system and brings to bear evidence from language acquisition and animal communication, as well as from psychological studies of audiovisual adaptation. Fentress's chapter proposes that the study of less com-
