Risk And Medical Decision Making:

Risk and Medical Decision Making Louis Eeckhoudt, 2002-04-30 For people interested in risk management medical activity represents a stimulating field of study and thought On the one hand progress in medical knowledge and technology tends to reduce the risks to survival that individuals would face in the absence of appropriate diagnostic or therapeutic instruments On the other hand new medical technologies simultaneously create their own specific risks sometimes simply because their effects are less well known than those of established ones In a sense any medical progress simultaneously generates new risks while destroying old ones Moreover unlike many financial risks that can be either divided or transferred to others e g through diversification insurance or social security the personal aspects of medical risks are by essence indivisible and non transferable As a result they are in a sense more threatening than financial risks for risk averse patients These two facts explain and justify the growing interest in risk economics for the fields of medical decision making and health economics In *Risk and Medical Decision Making* part 1 is developed inside the expected utility E U model and analyses how comorbidity risks affect the well known test treatment thresholds Part 2 is devoted to a specific non E U model with the same purpose how would one define a threshold in this context and how would one value a diagnostic test In each of these two parts both diagnostic and therapeutic risks are considered

Medical Decision Making Stefan Felder, Thomas Mayrhofer, 2022-04-04 This textbook offers a comprehensive analysis of medical decision making under uncertainty by combining test information theory with expected utility theory The authors show how the parameters of Bayes theorem can be combined with a value function of health states in order to arrive at informed test and treatment decisions in the face of diagnostic and therapeutic risks Distinguishing between risk neutral risk averse and prudent decision makers they demonstrate the effects of risk preferences on medical decisions Furthermore they analyze individual and multiple tests as well as diagnostic models in which the decision maker chooses the test outcome The consequences of test and treatment decisions for the patient are encompassed by quality adjusted life years QALYs and the standard economic model which applies the willingness to pay for health approach Lastly non expected utility models of choice under risk and uncertainty are presented Although these models can explain some of the test and treatment decisions observed they are less suitable for normative analyses aimed at providing guidance on medical decision making This third edition provides extensively revised versions of all chapters and reflects recent innovations in medical decision making such as decision curve analysis New chapters focus on the health economics of and revealed preferences in medical decisions The book is intended for students of health economics and medicine as well as for medical decision makers and physicians dealing with uncertainty in their test and treatment decisions
