Zucker, 2012-12-06 It has been said that never in the history of human progress has a better and cheaper method of preventing illness been developed than immunization This is well illustrated by the WHO Expanded Programme on Immunization EPI which in developing countries is now preventing nearly a million deaths annually from measles pertussis and neonatal tetanus and for which there is a commitment by the WHO and UNICEF to protect all children by immunization by the end of the decade This enormous undertaking will be facilitated by the rapid advances in molecular biology and recombinant DNA technology in the understanding of immunological mechanisms and by the production and application of monoclonal antibodies so that the structure and location of important antigenic determinants or epitopes can be determined Chemical synthesis of oligopeptides has been simplified and computer programmes and X ray crystallography provide the tools for the determination of three dimensional structure of proteins so that the structure and location of important antigenic determinants or epitopes can be predicted These techniques have opened the way to the improvement of existing vaccines and to the development and production of new vaccines against infections for which vaccines are not available New vaccines under development include vaccines against hepatitis B hepatitis A malaria vaccines for typhoid cholera rota virus infection and other diarrhoeal diseases leprosy rabies the acquired immune deficiency syndrome AIDS rubella EB virus schistosomiasis and other infections These recent developments are discussed in the volume by internationally recognized experts assembled from several countries **Remington and Klein's Infectious Diseases of the Fetus and Newborn Infant, E-Book** Yvonne Maldonado, Victor Nizet, Elizabeth D. Modern Vaccinology Edouard Kurstak, 2013-11-09 The recent developments in modern vaccinology are mainly based on i cloning of microbial genes into recombinant vectors containing genetic information for expression of desired neutralizing immunogens ii alternatives of attenuated vectors with deleted genes permitting the insertion of several foreign genes expressing antigens exposed to the host immune system during the abortive replication of such vectors iii combined vaccines with the aim to protect against many diseases with a limited number of administrations iv evidence demonstrating the ability of animals to respond serologically to DNA injections considered as a potential method of vaccination v the possibility to manipulate the immune system with new and improved immunomodulators enhancing the immune response and vi new microcarrier systems for particular immunogens or immunomodulators delivery either in a single dose or sustained release and presentation to the immune system for a relevant response New vaccines being developed are mainly based on viral bacterial or other vectors modified with genetic

engineering technology to possess and express desired antigens for vaccination against single or multiple infections Existing combined vaccines like diphtheria tetanus pertussis DTP are also experimented with new additional components like recombinant hepatitis B virus surface antigen inactivated poliovirus and Haemophilus influenzae type b immunogens in order to produce multivalent vaccines Such types of vaccines permitting the reduction of multiple medical visits is of particular interest to pediatric immunization programs and would benefit especially the developing countries assuring better vaccine compliance with immunization schedules *National Immunization Conference Proceedings* ,1993 *Principles and Practice of Pediatric Infectious Diseases E-Book* Marc Fischer,Sarah S.
