Remote Sensing for Target Object Detection and

Identification Gemine Vivone, Paolo Addesso, Amanda Ziemann, 2020-03-06 Target object detection and identification are among the primary uses for a remote sensing system. This is crucial in several fields including environmental and urban monitoring, hazard and disaster management, and defense and military. In recent years, these analyses have used the tremendous amount of data acquired by sensors mounted on satellite, airborne, and unmanned aerial vehicle (UAV) platforms. This book promotes papers exploiting different remote sensing data for target object detection and identification, such as synthetic aperture radar (SAR) imaging and multispectral and hyperspectral imaging. Several cutting edge contributions, which provide examples of how to select a technology or another depending on the specific application, will be detailed.

Jean-Charles Pinoli, 2014-07-09 Image processing and image analysis are typically important fields in information science and technology. By image processing, we generally understand all kinds of operation performed on images or sequences of images in order to increase their quality, restore their original content, emphasize some particular aspect of the information, or optimize their transmission, or to perform radiometric and/or spatial analysis. By image analysis, we understand, however, all kinds of operation performed on images or sequences of images in order to extract qualitative or quantitative data, perform measurements, and apply statistical analysis. Whereas there are nowadays many books dealing with image processing, only a small number deal with image analysis. The methods and techniques involved in these fields, of course, have a wide range of applications in our daily world: industrial vision, material imaging, medical imaging, biological imaging, multimedia applications, satellite imaging, quality control, traffic control, and so on. *Audio- and Video-Based Biometric Person Authentication* Josef
