algorithmic steps and the MATLABTM code for the following group of despeckle filters linear filtering nonlinear filtering anisotropic diffusion filtering and wavelet filtering The book proposes a comparative evaluation framework of these despeckle filters based on texture analysis image quality evaluation metrics and visual evaluation by medical experts in the assessment of cardiovascular ultrasound images recorded from the carotid artery The results of our work presented in this book suggest that the linear local statistics filter DsFlsmv gave the best performance followed by the nonlinear geometric filter DsFgf4d and the linear homogeneous maskarea filter DsFlsminsc These filters improved the class separation between the asymptomatic and the symptomatic classes of ultrasound images recorded from the carotid artery for the assessment of stroke based on the statistics of the extracted texture features gave only a marginal improvement in the classification success rate and improved the visual assessment carried out by two medical experts A despeckle filtering analysis and evaluation framework is proposed for selecting the most appropriate filter or filters for the images under investigation These filters can be further developed and evaluated at a larger scale and in clinical practice in the automated image and video segmentation texture analysis and classification not only for medical ultrasound but for other modalities as well such as synthetic aperture radar SAR images
