Changes in Visual Performance After Visual Work James Deese,1957 This report critically reviews some of the experimental and field studies on the effects of prolonged visual work It is pointed out in the report that there are two basically different kinds of visual work one primarily involving search for infrequently occurring signals vigilance tasks and the other involving active continuous use of the oculomotor system and requiring more or less continuous mental operation active tasks The effects of work at these two types of tasks on the capacity for further visual work are different Even relatively brief periods of time spent at visual vigilance results in a reduction in visual sensitivity Relatively long periods of time at active tasks produce either no deterioration or very little deterioration in the capacity for further visual work unless the situation is complicated by extreme loss of sleep anoxemia or presence of drug effects Continuous work at active visual tasks however does produce depression headaches feelings of tiredness and irritability Any attempt at reducing fatigue in active visual tasks should be directed towards these factors Abstract
