**Many-Particle Spectroscopy of Atoms, Molecules, Clusters, and Surfaces** J. Berakdar, J. Kirschner, 2012-12-06

Since the early days of modern physics spectroscopic techniques have been employed as a powerful tool to assess existing theoretical models and to uncover novel phenomena that promote the development of new concepts. Conventionally the system to be probed is prepared in a well defined state. Upon a controlled perturbation one measures then the spectrum of a single particle electron photon etc emitted from the probe. The analysis of this single particle spectrum yields a wealth of important information on the properties of the system such as optical and magnetic behaviour. Therefore such analysis is nowadays a standard tool to investigate and characterize a variety of materials. However it was clear at a very early stage that real physical compounds consist of many coupled particles that may be excited simultaneously in response to an external perturbation. Yet the simultaneous coincident detection of two or more excited species proved to be a serious technical obstacle in particular for extended electronic systems such as surfaces. In recent years however coincidence techniques have progressed so far as to image the multi particle excitation spectrum in an impressive detail. Correspondingly many body theoretical concepts have been put forward to interpret the experimental findings and to direct future experimental research. This book gives a snapshot of the present status of multi particle coincidence studies both from a theoretical and an experimental point of view. It also includes selected topical review articles that highlight the achievements and the power of coincident techniques. *Many-Particle Spectroscopy of Atoms, Molecules, Clusters, and Surfaces* J. Clusters and Surfaces 2014 (MPS 2014) ,2015      International Conference on Many Particle Spectroscopy of Atoms, Molecules, Clusters and Surfaces (MPS 2014) International Conference on Many Particle Spectroscopy of Atoms, Molecules, and Surfaces,2015      *Many-Particle Quantum Dynamics in Atomic and Molecular Fragmentation* Joachim Ullrich,V.P. Shevelko,2013-06-29 This book aims to give a comprehensive view on the present status of a tremendously fast developing field the quantum dynamics of fragmenting many particle Coulomb systems In striking contrast to the profound theoretical knowledge achieved from extremely precise experimental results on the static atomic and molecular structure it was only three years ago when the three body fundamental dynamical problem of breaking up the hydrogen atom by electron impact was claimed to be solved in a mathematically consistent way Until now more complicated though still fundamental scenarios addressing the complete fragmentation of the simplest many electron system the helium atom under the action of a time dependent external force have withstood any consistent theoretical description Exceptions are the most trivial situations where the breakup is induced by the impact of a single real photon or of a virtual photon under a perturbation caused by fast low charged particle impact Similarly the dissociation of the simplest molecular systems like H<sub>2</sub> or HD fragmenting in collisions with slow electrons or the H<sub>3</sub> molecule breaking apart into two or three pieces as a result of a single laser photon excitation establish a major challenge for state of the art theoretical approaches      **International Conference on Many Particle Spectroscopy of Atoms, Molecules, Clusters and Surfaces** ,2008      **Correlation Spectroscopy of Surfaces, Thin Films, and Nanostructures** Jamal Berakdar,Jürgen Kirschner,2006-03-06 Here leading scientists present an overview of the most modern experimental and theoretical methods for studying electronic correlations on surfaces in thin films and in nanostructures In particular they describe in detail coincidence techniques for studying many particle correlations while critically examining the informational content of such processes from a theoretical point viewpoint Furthermore the book considers the current state of incorporating many body effects into theoretical approaches Covered topics Auger electron photoelectron coincidence experiments and theories Correlated electron emission from atoms fullerenes clusters metals and wide band gap materials Ion coincidence spectroscopies and ion scattering theories from surfaces GW and dynamical mean field approaches Many body effects in electronic and optical response      Solid-State Photoemission and Related Methods Wolfgang Schattke,Michel A. Van Hove,2008-09-26 Photoemission is one of the principal techniques for the characterization and investigation of condensed matter systems The field has experienced many developments in recent years which may also be put down to important achievements in closely related areas This timely and up to date handbook is written by experts in the field who provide the background needed by both experimentalists and theorists It represents an interesting framework for showing the connection between theory and experiment by bringing together different concepts in the investigation of the properties of materials The work addresses the geometric and electronic structure of solid surfaces and interfaces theoretical methods for direct computation of spectra experimental techniques for data acquisition and physical models for direct data

interpretation It also includes such recent developments as full hemisphere acceptance in photoemission two electron photoemission  $e^+e^-$  electron diffraction and photoelectron electron hole interaction      **Fast Ion-atom And Ion-molecule Collisions** Dzevad Belkic, 2012-09-24 The principal goal of this book is to provide state of the art coverage of the non relativistic three and four body theories at intermediate and high energy ion atom and ion molecule collisions The focus is on the most frequently studied processes electron capture ionization transfer excitation and transfer ionization The content is suitable both for graduate students and experienced researchers For these collisions the literature has seen enormous renewal of activity in the development and applications of quantum mechanical theories This subject is of relevance in several branches of science and technology like accelerator based physics the search for new sources of energy and high temperature fusion of light ions Other important applications are in life sciences via medicine where high energy ion beams are used in radiotherapy for which a number of storage ring accelerators are in full operation under construction or planned to be built worldwide Therefore it is necessary to review this field for its most recent advances with an emphasis on the prospects for multidisciplinary applications      International Conference on Many Particle Spectroscopy of Atoms, Molecules, Clusters and Surfaces ,2011
