Mathematical Physics Part II:

Differential Geometry and Mathematical Physics Gerd Rudolph, Matthias Schmidt, 2012-11-09 Starting from an undergraduate level this book systematically develops the basics of Calculus on manifolds vector bundles vector fields and differential forms Lie groups and Lie group actions Linear symplectic algebra and symplectic geometry Hamiltonian systems symmetries and reduction integrable systems and Hamilton Jacobi theory The topics listed under the first item are relevant for virtually all areas of mathematical physics The second and third items constitute the link between abstract calculus and the theory of Hamiltonian systems The last item provides an introduction to various aspects of this theory including Morse families the Maslov class and caustics The book guides the reader from elementary differential geometry to advanced topics in the theory of Hamiltonian systems with the aim of making current research literature accessible The style is that of a mathematical textbook with full proofs given in the text or as exercises The material is illustrated by numerous detailed examples some of which are taken up several times for demonstrating how the methods evolve and interact **Literature**

Bunge, 2012-12-06 The aims of this Introduction are to characterize the philosophy of science and technology henceforth PS T to locate it on the map of learning and to propose criteria for evaluating work in this field 1 THE CHASM BETWEEN S T AND THE HUMANITIES It has become commonplace to note that contemporary culture is split into two unrelated fields science and the rest to deplore this split and to do is some truth in the two cultures thesis and even nothing about it There greater truth in the statement that there are literally thousands of fields of knowledge each of them cultivated by specialists who are in most cases indifferent to what happens in the other fields But it is equally true that all fields of knowledge are united though in some cases by weak links forming the system of human knowledge Because of these links what advances remains stagnant or declines is the entire system of S T Throughout this book we shall distinguish the main fields of scientific and technological knowledge while at the same time noting the links that unite them **Calendar of the University of Sydney**

Plasma Astrophysics, Part II Boris V. Somov, 2007-12-31 Magnetic fields are easily generated in astrophysical plasma owing to its high conductivity Magnetic fields having strengths of order few 10 G correlated on several kiloparsec scales are seen in spiral galaxies Their origin could be due to amplification of a small seed field by a turbulent galactic dynamo In several galaxies like the famous M51 magnetic fields are well correlated or anti correlated with the optical spiral arms These are the weakest large scale fields observed in cosmic space The strongest magnets in space are presumably the so called magnetars the highly magnetized with the strength of the field of about 10¹⁵ G young neutron stars formed in the supernova explosions The energy of magnetic fields is accumulated in astrophysical plasma and the sudden release of this energy an original electrodynamical burst or explosion takes place under definite but quite general conditions Patt 1992 Sturrock 1994 Kivelson and Russell 1995 Rose 1998 Priest and Forbes 2000 Somov 2000 Kundt 2001 Such a field in astrophysical plasma is accompanied by fast directed ejections jets of
