Minimal Surfaces Of Codimension One:

Minimal Surfaces of Codimension One U. Massari, M. Miranda, 2000-04-01 This book gives a unified presentation of different mathematical tools used to solve classical problems like Plateau's problem, Bernstein's problem, Dirichlet's problem for the Minimal Surface Equation and the Capillary problem. The fundamental idea is a quite elementary geometrical definition of codimension one surfaces. The isoperimetric property of the Euclidean balls together with the modern theory of partial differential equations are used to solve the 19th Hilbert problem. Also included is a modern mathematical treatment of capillary problems.

A Survey of Minimal Surfaces Robert Osserman, 2013-12-10 Newly updated accessible study covers parametric and non parametric surfaces, isothermal parameters, Bernstein's theorem, much more including such recent developments as new work on Plateau's problem and on isoperimetric inequalities. Clear comprehensive examination provides profound insights into crucial area of pure mathematics. 1986 edition. Index.

Cartesian Currents in the Calculus of Variations I Mariano Giaquinta, Giuseppe Modica, Jiri Soucek, 1998-08-19 This monograph in two volumes deals with non scalar variational problems arising in geometry as harmonic mappings between Riemannian manifolds and minimal graphs and in physics as stable equilibrium configurations in nonlinear elasticity or for liquid crystals. The presentation is selfcontained and accessible to non specialists. Topics are treated as far as possible in an elementary way illustrating results with simple examples in principle chapters and even sections are readable independently of the general context so that parts can be easily used for graduate courses. Open questions are often mentioned and the final section of each chapter discusses references to the literature and sometimes supplementary results. Finally a detailed Table of Contents and an extensive Index are of help to consult this monograph.

Almgren, 1986 Includes twenty six papers that survey a cross section of work in modern geometric measure theory and its applications in the calculus of variations This title provides an access to the material including introductions and summaries of many of the authors much longer works and a section containing 80 open problems in the field

Recent Trends in Lorentzian Geometry Miguel Sánchez, Miguel Ortega, Alfonso Romero, 2012-11-06 Traditionally Lorentzian geometry has been used as a necessary tool to understand general relativity as well as to explore new genuine geometric behaviors far from classical Riemannian techniques Recent progress has attracted a renewed interest in this theory for many researchers long standing global open problems have been solved outstanding Lorentzian spaces and groups have been classified new applications to mathematical relativity and high energy physics have been found and further connections with other geometries have been developed Samples of these fresh trends are presented in this volume based on contributions from the VI International Meeting on Lorentzian Geometry held at the University of Granada Spain in September 2011 Topics such as geodesics maximal trapped and constant mean curvature submanifolds classifications of manifolds with relevant symmetries relations between Lorentzian and Finslerian geometries and applications to mathematical physics are included This book will be suitable for a broad audience of differential geometers mathematical physicists and relativists and researchers in the field

Variational Problems in Topology A.T. Fomenko, 2019-06-21 Many of the modern variational problems of topology arise in different but overlapping fields of scientific study mechanics physics and mathematics In this work Professor Fomenko offers a concise and clear explanation of some of these problems both solved and unsolved using current methods of analytical topology His book falls into three interrelated sections The first gives an elementary introduction to some of the most important concepts of topology used in modern physics and mechanics homology and cohomology and fibration The second investigates the significant role of Morse theory in modern aspects of the topology of smooth manifolds particularly those of three and four dimensions The third discusses minimal surfaces and harmonic mappings and presents a number of classic physical experiments that lie at the foundations of modern understanding of multidimensional variational calculus The author's skilful exposition of these topics and his own graphic illustrations give an unusual motivation to the theory expounded and his work is recommended reading for specialists and non specialists alike involved in the fields of physics and mathematics at both undergraduate and graduate levels

Analysis and Geometry of Metric Measure Spaces Galia Devora Dafni, Robert John McCann, Alina Stancu, 2013 Contains lecture notes from most of the courses presented at the 50th anniversary edition of the Seminaire de Mathematiques Superieure in Montreal This 2011 summer school was devoted to the analysis and geometry of metric measure spaces and featured much interplay between this subject and the emergent topic of optimal transportation

Topics in Disordered Systems Charles M. Newman, 2012-12-06 Disordered systems are

statistical mechanics models in random environments This lecture notes volume concerns the equilibrium properties of a few carefully chosen examples of disordered Ising models The approach is that of probability theory and mathematical physics but the subject matter is of interest also to condensed matter physicists material scientists applied mathematicians and theoretical computer scientists The two main types of systems considered are disordered ferromagnets and spin glasses The emphasis is on questions concerning the number of ground states at zero temperature or the number of pure Gibbs states at nonzero temperature A recurring theme is that these questions are connected to interesting issues concerning percolation and related models of geometric combinatorial probability One question treated at length concerns the low temperature behavior of short range spin glasses whether and in what sense Parisi's analysis of the meanfield or infinite range model is relevant Closely related is the more general conceptual issue of how to approach the thermodynamic i e infinite volume limit in systems which may have many complex competing states This issue has been addressed in recent joint work by the author and Dan Stein and the book provides a mathematically coherent presentation of their approach

Tensor and Vector Analysis A.T. Fomenko, V.V. Trofimov, O V Manturov, 1998-11-26 Reflecting the significant contributions of Russian mathematicians to the field this book contains a selection of papers on tensor and vector analysis It is divided into three parts covering Hamiltonian systems Riemannian geometry and calculus of variations and topology The range of applications of these topics is very broad as many modern geometrical problems recur across a wide range of fields including mechanics and physics as well as mathematics Many of the approaches to problems presented in this volume will be novel to the Western reader although questions are of global interest The main achievements of the Russian school are placed in the context of the development of each individual subject

A Sufficient Criterion for a Cone to be Area-Minimizing Gary Reid Lawlor,1991 One of the fundamental objects of study in geometric measure theory is an area minimizing surface A compact k dimensional surface with boundary is called area minimizing if no other surface with the same boundary has less surface area An area minimizing surface can have singularities The main purpose of this paper is to investigate some of the shapes that such singularities can have A key concept in this study is that of an area minimizing cone We present a general method for proving that a cone with an isolated singularity is area minimizing The calculation involves the curvature second fundamental form and a sort of embedding radius of the normal bundle to the cone We can also prove that certain cones are not area minimizing Using this method we complete the classification of minimizing cones over products of spheres We also give other examples including the first known unorientable minimizing cones The method also lends itself to perturbation arguments We show that certain surfaces are area minimizing in a small neighborhood of an isolated singularity
