**Neuroparasitology and Tropical Neurology** Peruvumba Narayan Jayakumar, Hoskote S. Chandrashekar, Shehanaz Ellika, 2013-07-03 Parasitic infections of the central nervous system CNS have increased over the last couple of decades partly due to a drop in the living conditions of large populations in the world and the AIDS epidemic Parasitic infections of the CNS are indolent and often life threatening hence an early diagnosis is imperative While brain biopsy and laboratory analysis remain the gold standard for diagnosis neuroimaging contributes significantly to diagnosis and follow up Imaging can demonstrate the extent of infection and complications and possibly the type of parasitic infection when characteristic features are evident The disappearance of the parasite or inflammation gliosis and or calcification suggest a therapeutic response The initial experience of the CT scan has been greatly enhanced by MRI which is currently the imaging modality of choice This has been due to the greater tissue contrast resolution of MRI and its ability to detect subtle changes in the tissue parenchyma Advanced techniques such as diffusion weighted imaging DWI perfusion imaging PI MR angiography MRA and MR spectroscopy MRS have been used to improve the sensitivity for characterizing the type viability and burden of the parasites and the host tissue response Additionally it is possible to demonstrate the complications of the primary infection and those secondary to treatment in some cases
