R.P. Shaw ,2015-06-11 Understanding the behaviour of gases in the context of radioactive waste disposal is a fundamental  
requirement in developing a safety case for the disposal of radioactive waste Of particular importance are the long term  
performance of bentonite buffers and cement based backfill materials that may be used to encapsulate and surround the  
waste in a repository and the behaviour of plastic clays indurated mudrocks and crystalline formations that may be the host  
rocks for a repository The EC Euratom programme funded project FORGE has provided new insights into the processes and  
mechanisms governing gas generation and migration with the aim of reducing uncertainty This volume brings together  
papers on aspects of this topic arising from both the FORGE project and work undertaken elsewhere This has been achieved  
by the acquisition of new experimental data coupled with modelling through a series of laboratory and field scale  
experiments performed at a number of underground research laboratories throughout Europe      **North Eastern Reporter**
