Many Body Tree Methods In Physics:

Many-Body Tree Methods in Physics Susanne Pfalzner, Paul Gibbon, 1996-10-13 Studying the dynamics of a large number of particles interacting through long range forces commonly referred to as the N body problem is a central aspect of many different branches of physics In recent years physicists have made significant advances in the development of fast N body algorithms to deal efficiently with such complex problems This book gives a thorough introduction to these so called tree methods setting out the basic principles and giving many practical examples of their use The authors assume no prior specialist knowledge and they illustrate the techniques throughout with reference to a broad range of applications The book will be of great interest to graduate students and researchers working on the modeling of systems in astrophysics plasma physics nuclear and particle physics condensed matter physics and materials science

Fast Methods for Long-range Interactions in Complex Systems Godehard Sutmann, Paul Gibbon, Thomas Lippert, 2011 *Applications, Tools and Techniques on the Road to Exascale Computing* Koen de Bosschere, Mark Sawyer, 2012 Single processing units have now reached a point where further major improvements in their performance are restricted by their physical limitations This is causing a slowing down in advances at the same time as new scientific challenges are demanding exascale speed This has meant that parallel processing has become key to High Performance Computing HPC This book contains the proceedings of the 14th biennial ParCo conference ParCo2011 held in Ghent Belgium The ParCo conferences have traditionally concentrated on three main themes Algorithms Architectures and Applications Nowadays though the focus has shifted from traditional multiprocessor topologies to heterogeneous and manycores incorporating standard CPUs GPUs Graphics Processing Units and FPGAs Field Programmable Gate Arrays These platforms are at a higher abstraction level integrated in clusters grids and clouds The papers presented here reflect this change of focus New architectures programming tools and techniques are also explored and the need for exascale hardware and software was also discussed in the industrial session of the conference This book will be of interest to all those interested in parallel computing today and progress towards the exascale computing of tomorrow

Parallel Computing Barbara Chapman, 2010 From Multicores and GPUs to Petascale Parallel computing technologies have brought dramatic changes to mainstream computing the majority of todays PCs laptops and even notebooks incorporate multiprocessor chips with up to four processors Standard components are increasingly combined with GPUs Graphics Processing Unit originally designed for high speed graphics processing and FPGAs Free Programmable Gate Array to build parallel computers with a wide spectrum of high speed processing functions The scale of this powerful hardware is limited only by factors such as energy consumption and thermal control However in addition to

The Economics of Interfirm Networks Tsutomu Watanabe, Ichiro Uesugi, Arito Ono, 2015-06-02 This book is one of the

first comprehensive works to fill the knowledge gap resulting from the limited number of empirical studies on interfirm networks. The in depth empirical research presented here is based on a massive transaction relationship database of approximately 400 000 Japanese firms. This volume unlike others focuses on the role of interfirm networks in three different fields: 1 macroeconomic activities, 2 economic geography and firm dynamics, and 3 firm bank relationships. The database for this work is constructed in collaboration with Japan's largest credit research company Teikoku Data Bank and covers a substantial portion of Japanese firms with information on firms' transaction partners, shareholders, financial institutions, and other attributes including their locations and performance. Networks prevail in many aspects of economic activities and play a major role in explaining a wide variety of economic phenomena from business cycles to knowledge spillovers, which has motivated economists to produce a number of excellent works. In the policy arena, there has been a growing concern on the vulnerabilities of networks based on the casual observation that idiosyncratic shocks on firms can be amplified through interfirm connections and leads to a systemic crisis. Typical examples are the manufacturing supply chain networks in the automobile and electronics industries which propagated regionally concentrated shocks: the Great East Japan Earthquake and floods in Thailand in 2011 into global ones. An abundance of theoretical literature on the formation and functions of networks is available already. This book breaks new ground, however, and provides an excellent opportunity for the reader to gain a more integrated understanding of the role of networks in the economy. *The Economics of Interfirm Networks* will be of special interest to economists and practitioners seeking empirical and quantitative knowledge on interfirm and firm bank networks.

Workshop on Molecular Dynamics on Parallel Computers Rüdiger Esser, 2000. Molecular dynamics is a well established technique for simulating complex many particle systems in many areas of physics, chemistry, and astrophysics. The huge computational requirements for simulations of large systems, especially with long range forces, demand the use of massively parallel computers. Designing efficient algorithms for these problems is a highly non trivial task. This book contains the invited talks and abstracts presented at a conference by more than 100 researchers from various fields: computer science, solid state physics, high energy physics, polymers, biochemistry, granular materials, and astrophysics. Most of the contributions have been written by users of massively parallel computers and deal with practical issues, but there are also contributions tackling more fundamental algorithmic problems.
