Guptill, J.L. Morrison, 2013-10-22 *Elements of Spatial Data Quality* outlines the need and suggests potential categories for the content of a comprehensive statement of data quality that must be imbedded in the metadata that accompanies the transfer of a digital spatial data file or is available in a separate metadata catalog Members of the International Cartographic Association s Commission on Spatial Data Quality have identified seven elements of data quality positional accuracy attribute accuracy completeness logical consistency lineage semantic accuracy and temporal information In the book the authors describe components of each data quality element possible metrics that can be used to measure the quality of each criteria possible testing and rating schemes and how these parameters might differ from a producer or user point of view Finally no volume of this nature would be complete without a chapter devoted to necessary future research in this subject area The chapter points out areas in need of further investigation and speculates about the use and transfer of

digital spatial data in tomorrow's electronic world and at developments in presenting specified data quality information in a visualization. This book will be of interest to all of those individuals involved in geographical information systems and spatial data handling. *Technical Papers of the 44th Annual Meeting of the American Congress on Surveying and Mapping*, American Congress on Surveying and Mapping, Annual Meeting, 1984. **GIS Environmental Modelling and Engineering** Allan Brimicombe, 2003-08-29. Spatial dimensions need to be properly captured if modelling and engineering techniques are to be successfully applied in addressing environmental problems. The links between the geographical information systems GIS that capture this data simulation modelling and engineering offer tremendous possibilities for building versatile support systems for managing the environment. GIS Environmental Modelling and Engineering focuses on using GIS and external models to solve real environmental problems promoting the critical thinking needed for the effective applications of these systems and their analytical outputs. Divided into three major sections, this textbook first concentrates on defining GIS, identifying how data is structured and explaining common functionality. The text examines GIS from a technological perspective, exploring the evolution of its scientific basis and its synergies with other technologies within a geocomputational paradigm. The next section explores modelling from a neutral scientific perspective in its role of simulating phenomena as well as from a more specific perspective in its role within environmental science and engineering. The third and largest section looks at how GIS and simulation modelling are joined. It provides case studies and covers issues such as interoperability, data quality, model validity, space-time dynamics and decision support systems. This volume provides seniors and postgraduate students with a structured, coherent text that goes beyond introductory subject matter by enabling readers to think critically about the data acquisition process and the results they get from the technology. **Journal of the Surveying and Mapping Division**, 1982.
