Mathematical Theory Of Information:

The Mathematical Theory of Communication Claude E Shannon, Warren Weaver, 1949 Scientific knowledge grows at a phenomenal pace but few books have had as lasting an impact or played as important a role in our modern world as The Mathematical Theory of Communication published originally as a paper on communication theory more than fifty years ago Republished in book form shortly thereafter it has since gone through four hardcover and sixteen paperback printings It is a revolutionary work astounding in its foresight and contemporaneity The University of Illinois Press is pleased and honored to issue this commemorative reprinting of a classic The Mathematical Theory of Information Jan Kahre, 2002-06-30 The Mathematical Theory of Information presents a new mathematical theory of information built on a single powerful postulate the Law of Diminishing Information The concept of information is here for the first time defined mathematically by adding this postulate to the axioms of the probability theory The Law of Diminishing Information is founded on a fusion of two fundamental ideas Carnap and Bar Hillel's Ideal Receiver and Shannon's Noisy Channel The Law of Diminishing Information is applied to information technology game theory legislation logic of research algorithmic information chaos theory control engineering medical tests and biological evolution In physics both the Second Law of Thermodynamics and Schrodinger's wave function are derived from the Law of Diminishing Information Conventional information theory that of telecommunications is analyzed as a special case and eight conditions for its applicability are listed The reader will get the essential ideas to understand and use the concept of information The Mathematical Theory of Information is suitable as a textbook in general information theory for students of technical scientific and mathematical subjects The book is ideal as a supplementary textbook in traditional courses on telecommunications information theory at all levels The website of the book is www.mattheory.info The mathematical theory of communication Claude Elwood Shannon, Warren Weaver, 1949

The Mathematical Theory of Coding Ian F. Blake, Ronald C. Mullin, 2014-05-10 The Mathematical Theory of Coding focuses on the application of algebraic and combinatoric methods to the coding theory including linear transformations vector spaces and combinatorics The publication first offers information on finite fields and coding theory and combinatorial constructions and coding Discussions focus on self dual and quasicyclic codes quadratic residues and codes balanced incomplete block designs and codes bounds on code dictionaries code invariance under permutation groups and linear transformations of vector spaces over finite fields The text then takes a look at coding and combinatorics and the structure of semisimple rings Topics include structure of cyclic codes and semisimple rings group algebra and group characters rings ideals and the minimum condition chains and chain groups dual chain groups and matroids graphs and coding The book ponders on group representations and group codes for the Gaussian channel including distance properties of group codes initial vector problem modules group algebras and representations orthogonality relationships and properties of group characters and representation of groups The manuscript is a valuable source of data for mathematicians and researchers

Transmitting and Gaining Data Rudolf Ahlswede, 2014-11-15 The calculation of channel capacities was one of Rudolf Ahlswede's specialties and is the main topic of this second volume of his Lectures on Information Theory Here we find a detailed account of some very classical material from the early days of Information Theory including developments from the USA Russia Hungary and which Ahlswede was probably in a unique position to describe the German school centered around his supervisor Konrad Jacobs These lectures made an approach to a rigorous justification of the foundations of Information Theory This is the second of several volumes documenting Rudolf Ahlswede's lectures on Information Theory Each volume includes comments from an invited well known expert In the supplement to the present volume Gerhard Kramer contributes his insights Classical information processing concerns the main tasks of gaining knowledge and the storage transmission and hiding of data The first task is the prime goal of Statistics For transmission and hiding data Shannon developed an impressive mathematical theory called Information Theory which he based on probabilistic models The theory largely involves the concept of codes with small error probabilities in spite of noise in the transmission which is modeled by channels The lectures presented in this work are suitable for graduate students in Mathematics and also for those working in Theoretical Computer Science Physics and Electrical Engineering with a background in basic Mathematics The lectures can be used as the basis for courses or to supplement courses in many ways Ph D students will also find research problems often with conjectures that offer potential subjects for a thesis More advanced researchers may find questions which form the basis of entire research programs **The Mathematical Theory of Communication** Claude E Shannon, Warren
