Mathematics Mechanization And Applications:

Mathematics Mechanization and Applications Xiao-Shan Gao, Dongming Wang, 2000-07-25 Mathematics Mechanization and Applications provides surveys for major research developments on mechanizing algebraic equations solving and geometric theorem proving with diverse applications accomplished in Wu's extended Chinese group. The book addresses the frontiers of research with new and original ideas and results, includes sophisticated and successful applications to scientific and engineering problems, covers polynomial system solving, geometric reasoning, computer algebra, and mathematical software. It is comprehensive and focused and easy to read with a uniform presentation, contains an extensive bibliography of high value for reference to western readers. This book is of interest to researchers, software developers, and graduate students in symbolic and algebraic computation, automated theorem proving, algorithmic mathematics, and computer aided mathematical problem solving. It is relevant for researchers and university teachers in computer aided instruction and education, and for engineers and practitioners in mechanics, computer aided geometric design, geometric modelling, and robotics. People in many other related areas, from pure mathematics to computer aided design, particularly those who know of the Wu method but have little knowledge of it or the work that has arisen around it, will also find the book good reading.

Formal Algorithmic Elimination for PDEs Daniel Robertz,2014-10-13 Investigating the correspondence between systems of partial differential equations and their analytic solutions using a formal approach this monograph presents algorithms to determine the set of analytic solutions of such a system and conversely to find differential equations whose set of solutions coincides with a given parametrized set of analytic functions After giving a detailed introduction to Janet bases and Thomas decomposition the problem of finding an implicit description of certain sets of analytic functions in terms of differential equations is addressed Effective methods of varying generality are developed to solve the differential elimination problems that arise in this context

In particular it is demonstrated how the symbolic solution of partial differential equations profits from the study of the implicitization problem. For instance, certain families of exact solutions of the Navier-Stokes equations can be computed
