Dietary Fats, Lipids, Hormones, and

Tumorigenesis David Heber, David Kritchevsky, 2012-12-06 This book was inspired by a gathering of scientists in Los Angeles in 1994 under the auspices of the UCLA Clinical Nutrition Research Unit which is funded by the National Cancer Institute to promote new research into nutrition and cancer prevention. This unit supports research integrating basic and metabolic clinical investigations which examine observations from epidemiologic studies and their application to the prevention of common forms of cancer through nutritional intervention. There is a great deal of information from epidemiologic experimental and metabolic studies implicating elements of the diet as important in the development and progression of common forms of cancer including breast cancer, colon cancer, prostate cancer, and uterine cancer. When these forms of cancer are examined carefully, it is clear that they share a number of common etiologic factors related to dietary fat, lipids, and hormones. A human cancer is usually discovered at a point where it has formed a detectable mass. For many forms of cancer, this may require 10 to 15 years from the time when the cancer is first initiated. Nutritional efforts at prevention may delay the progression of cancer to a detectable mass, resulting in reduced incidence and may retard the clinical progression and metastatic spread of cancer after its primary treatment.
