Radiation In A Cloudy Atmosphere:

Radiation in a Cloudy Atmosphere E.M. Feigelson, 2013-06-29 Radiative heat transfer is a fundamental factor in the energetics of the terrestrial atmosphere the system consisting of the atmosphere and the underlying layer is heated by the Sun and this heating is compensated on the average by thermal radiation Only over a period of 1-3 days from some specified initial moment can the dynamic processes in the atmosphere be considered to be adiabatic Global dynamic processes of long duration are regulated by the actual influxes of heat one of the main ones being the radiative influx Radiation must be taken into account in long term weather forecasting and when considering the global circulation of the atmosphere the theory of climate etc Thus it is necessary to know the albedo of the system the amount of solar radiation transmitted by the atmosphere the absorptivity of the atmosphere vis a vis solar radiation and also the effective radiation flux the divergence of which represents the radiative cooling or heating All these quantities have to be integrated over the wavelength spectrum of the solar or thermal radiation and they must be ascertained as functions of the determining factors The relationships between the indicated radiation characteristics the optical quantities directly determining them the optically active components of the atmosphere and the meteorological fields will be discussed in this book [Radiation in a Cloudy Atmosphere](#)

E. Samuelson, 1965

The equation of radiative transfer in the context of a partially thermally emitting partially anisotropically scattering plane parallel cloudy atmosphere is derived The derivation allows an exact interpretation of the auxiliary quantities in the equation of transfer in terms of the Mie scattering parameters Explicit solutions are given the method of discrete ordinates in accordance with Chandrasekhar's procedure and extended to include thermal emission at infrared wavelengths Solutions of this type restricted to plane parallel layers bounded on both sides by a vacuum and characteristic of phase function for single

scattering independent of optical depth are referred to as solutions to the restricted problem To extend the treatment to the general problem a procedure wherein layers with different scattering properties are combined is developed in terms of the restricted solutions two explicit examples are worked out Such quantities as the angular distribution of outgoing radiation and the net outgoing flux are consequences of these solutions

Alexander Marshak, Anthony Davis, 2006-05-27 Developments in three dimensional cloud radiation over the past few decades are assessed and distilled into this contributed volume Chapters are authored by subject matter experts who address a broad audience of graduate students researchers and anyone interested in cloud radiation processes in the solar and infrared spectral regions After two introductory chapters and a section on the fundamental physics and computational techniques the volume extensively treats two main application areas the impact of clouds on the Earth's radiation budget which is an essential aspect of climate modeling and remote observation of clouds especially with the advanced sensors on current and future satellite missions

Atmospheric Aerosol Properties

Kirill Ya. Kondratyev, Lev S. Ivlev, Vladimir F. Krapivin, Costas A. Varostos, 2006-08-29 This book provides the first comprehensive analysis of how aerosols form in the atmosphere through in situ processes as well as via transport from the surface dust storms seas spray biogenic emissions forest fires etc Such an analysis has been followed by the consideration of both observation data various field observational experiments and numerical modeling results to assess climate impacts of aerosols bearing in mind that these impacts are the most significant uncertainty in studying natural and anthropogenic causes of climate change
