Changing Health Care Systems from Ethical, Economic, and Cross Cultural Perspectives Erich E.H. Loewy, 2007-05-08 This volume is the result of a conference sponsored by the Medical Alumni Association of the University of California Davis and held in Sacramento California in January 2000 The purpose of this conference was to examine the impact of various health care structures on the ability of health care professionals to practice in an ethically acceptable manner One of the ground assumptions made is that ethical practice in medicine and its related fields is difficult in a setting that pays only lip service to ethical principles The limits of ethical possibility are created by the system within which health care professionals must practice When for example ethical practice necessitates as it generally does that health care professionals spend sufficient time to come to know and understand their patients goals and values but the system mandates that only a short time be spent with each patient ethical practice is made virtually impossible One of our chief frustrations in teaching health care ethics at medical colleges is that we essentially teach students to do something they are most likely to find impossible to do that is get to know and appreciate their patients goals and values There are other ways in which systems alter ethical possibilities In a system in which patients have a different physician outside the hospital than they will inside ethical problems have a different shape than if the treating physician is the same person

Creating Value with Science and Technology Eliezer

Geisler,2001-08-30 Do science and technology create value for society and the economy and how might one go about measuring it How do we evaluate its benefits Can we even be certain that there are benefits Geisler argues that there are benefits and that they outweigh in value the negative impacts that inevitably accompany them His revolutionary new book goes on to show that they can also be measured and evaluated and in one volume all of the existing knowledge on how to do it is compiled then Geisler s own methods are offered The result is a compelling argument that the value of science and technology in our lives has indeed been positive and that the economic well being of all individuals organizations and nations rests upon them Geisler starts off by describing his conceptual framework for the evaluation of science and technology and the impact and benefits that proceed from them He discusses the nature of evaluation in general terms and then in the specific context of science technology and innovation together He reviews the state of our present knowledge and assesses the nature of value creation itself Throughout Geisler remains fixed on his driving thesis Although there are certainly some negative impacts from science and technology on the whole the results of its outputs are positive He shows how they have contributed to a range of activities and institutions particularly to the improvement of health and human welfare worldwide Finally after discussing the theories of evaluation he gets down to the practice providing readers with a way to assess science and technological innovations for themselves
