Mathematical Methods for Hydrodynamic Limits Anna DeMasi, Errico Presutti, 2006-11-14 Entropy inequalities correlation functions couplings between stochastic processes are powerful techniques which have been extensively used to give a rigorous foundation to the theory of complex many component systems and to its many applications in a variety of fields as physics biology population dynamics economics The purpose of the book is to make these and other mathematical methods accessible to readers with a limited background in probability and physics by examining in detail a few models where the techniques emerge clearly while extra difficulties are kept to a minimum Lanford's method and its extension to the hierarchy of equations for the truncated correlation functions the v functions are presented and applied to prove the validity of macroscopic equations for stochastic particle systems which are perturbations of the independent and of the symmetric simple exclusion processes Entropy inequalities are discussed in the frame of the Guo Papanicolaou Varadhan technique and of the Kipnis Olla Varadhan super exponential estimates with reference to zero range models Discrete velocity Boltzmann equations reaction diffusion equations and non linear parabolic equations are considered as limits of particles models Phase separation phenomena are discussed in the context of Glauber Kawasaki evolutions and reaction diffusion equations Although the emphasis is on the mathematical aspects the physical motivations are explained through the analysis of the single models without attempting however to survey the entire subject of hydrodynamical limits

Mathematical Problems and Methods of Hydrodynamic Weather Forecasting Vladimir Gordin, 2000-09-20 The material provides an historical background to forecasting developments as well as introducing recent advances The book will be of interest to both mathematicians and physicists the topics covered include equations of dynamical meteorology first integrals non linear stability well posedness of boundary problems non smooth solutions parameters and free oscillations meteorological data processing methods of approximation and interpolation and numerical methods for forecast modelling

Analytical Methods in Marine Hydrodynamics Ioannis K. Chatjigeorgiou, 2018-07-12 The value of analytical solutions relies on the rigorous formulation and a strong mathematical background This comprehensive volume unifies the most important geometries which allow for the development of analytical solutions for hydrodynamic boundary value problems It offers detailed explanations of the Laplace domain and numerical results associated with such problems providing deep insight into the theory of hydrodynamics Extended numerical calculations are provided and discussed allowing the reader to use them as benchmarks for their own computations and making this an invaluable resource for specialists in various disciplines including hydrodynamics acoustics optics electrostatics and brain imaging

hydrodynamics O. V. Troshkin, 1995-03-16 This book discusses a number of qualitative features of mathematical models of incompressible fluids Three basic systems of hydrodynamical equations are considered the system of stationary Euler equations for flows of an ideal nonviscous fluid stationary Navier Stokes equations for flows of a viscous fluid and Reynolds equations for the mean velocity field pressure and pair one point velocity correlations of turbulent flows The analysis concerns algebraic or geometric properties of vector fields generated by these equations such as the general arrangement of streamlines the character and distribution of singular points conditions for their absence or appearance and so on Troshkin carries out a systematic application of the analysis to investigate conditions for unique solvability of a number of problems for these quasilinear systems Containing many examples of particular phenomena illustrating the general ideas covered this book will be of interest to researchers and graduate students working in mathematical physics and hydrodynamics

SPDE in Hydrodynamics: Recent Progress and Prospects Sergio Albeverio, Franco Flandoli, Yakov G. Sinai, 2008-04-01. Of the three lecture courses making up the CIME summer school on Fluid Dynamics at Cetraro in 2005 reflected in this volume, the first due to Sergio Albeverio describes deterministic and stochastic models of hydrodynamics. In the second course, Franco Flandoli starts from 3D Navier-Stokes equations and ends with turbulence. Finally, Yakov Sinai in the 3rd course describes some rigorous mathematical results for multidimensional Navier-Stokes systems and some recent results on the one-dimensional Burgers equation with random forcing.

Riemann Solvers and Numerical Methods for Fluid Dynamics Eleuterio F. Toro, 2013-04-17. High-resolution upwind and centered methods are today a mature generation of computational techniques applicable to a wide range of engineering and scientific disciplines. Computational Fluid Dynamics (CFD) being the most prominent up to now. This textbook gives a comprehensive, coherent and practical presentation of this class of techniques. The book is designed to provide readers with an understanding of the basic concepts, some of the underlying theory, the ability to critically use the current research papers on the subject and, above all, with the required information for the practical implementation of the methods. Applications include compressible steady/unsteady reactive viscous/non-viscous and free surface flows.
