Mathematical Economics of General Equilibrium Akira Yamazaki, 2025-10-11 This book presents a rigorous formulation of the general equilibrium model in economies with topological and measurable mathematical structures It aims to provide basic tools and analytical methods for advanced graduate students and researchers interested in microeconomic theory and game theory It is based on lecture notes distributed among advanced graduate students in the advanced mathematical economics course at the Ph D level The book presents a unified treatment of the general equilibrium analysis of economies with perfectly competitive markets based on the Walrasian model It is divided into Part I and Part II The mathematical analysis of general equilibrium in perfectly competitive economies begins in Part II As a mathematical preparation for Part II for most economics students Part I collects some basic mathematical concepts and facts that are later needed and used in the theoretical economic analysis Some readers may wish to start the book from Part II and refer back to Part I whenever it is necessary to review mathematical concepts and related well known mathematical results referred to in the text The presentation of theoretical economic analysis of general equilibrium theory in Part II is organized chapter by chapter Basic Concepts of Equilibrium Analysis Mathematical Structure on the Space of Economic Agents Characteristics Individual Demands Economies with a Measure Space of Consumers Walrasian Equilibria of Economies Production Economies and Edgeworth Equilibria as the Core of Economies The mathematical analysis in this book uses topological and measurable structures that are essentially built into the model to provide an appropriate means of expressing the characteristics of economic agents that form a basic part of economies along with commodities in market transactions and market prices for valuation in markets

Mathematical Methods for Economic Theory 2 James C. Moore, 2013-03-14 This is the second of a two volume work intended to function as a textbook well as a reference work for economic for graduate students in economics as scholars who are either working in theory or who have a strong interest in economic theory While it is not necessary that a student read the first volume before tackling this one it may make things easier to have done so In any case the student undertaking a serious study of this volume should be familiar with the theories of continuity convergence and convexity in Euclidean space and have had a fairly

sophisticated semester's work in Linear Algebra While I have set forth my reasons for writing these volumes in the preface to Volume 1 of this work it is perhaps in order to repeat that explanation here I have undertaken this project for three principal reasons In the first place I have collected a number of results which are frequently useful in economics but for which exact statements and proofs are rather difficult to find for example a number of results on convex sets and their separation by hyperplanes some results on correspondences and some results concerning support functions and their duals Secondly while the mathematical topics taken up in these two volumes are generally taught somewhere in the mathematics curriculum they are never insofar as I am aware done in a two course sequence as they are arranged here
